1. Programming cable?

Yahoo group: UV-3R (2011)
Date: 2011-04-23 08:00:32 UTC
From: andyfoad@rocketmail.com
Topic: 1 Message: 1

What programing cable is needed ?

Is it possible to use a standard 4 pin jack plug type
like the YAESU VX7R ?

2. Programming software questions

Yahoo group: UV-3R (2011)
Date: 2011-04-23 08:04:37 UTC
From: andyfoad@rocketmail.com
Topic: 2 Message: 2

I have downloaded the software.

I notice that under the menu DEVICE there is an option
for E2 MAP, some sort of EEPROM dump with Hex Editor.

Does anyone have further information on this ?

Also, when programming software is used, what key functions
are required on the radio, if any to initiate communications ?

I am looking forward to receiving my UV3R soon, it has already
been ordered, but sadly there is not enough information about
it so far.

3. Re: Programming software questions

From: Bill
Topic: 2 Message: 3

Hi Andy,

The E2 Map is simply raw programming data. The inclusion of the table is for programmers and or debuggers and is of little use to end users.

As far as your question about initiating communications I'm not sure if I understand it or not? Once you have your tx/rx frequencies and any ctcss tones programmed wouldn't you just press the PTT button?

73s
Bill

So why include it on a bit of user software?

I suspect we may be treated at some point to some eeprom dumps
so that we can flash upgrade these little rigs.

That would be great, just wondering what could be varied in terms
of functionality though.

>
> As far as your question about initiating communications I'm not sure if I understand it or not? Once you have your tx/rx frequencies and any ctcss tones programmed wouldn't you just press the PTT button?

I was referring to initiating serial port comms between
the PC and rig.

For example, on my VX7R the rig is plugged into
the cable, switched on in a certain manner and then certain other
keypresses required to initiated a read or write from the radio.

Oh well, looks like this ultra new rig is gonna create quite a
buzz once users start receiving their samples.

From: Bill
Topic: 2 Message: 5

I have worked with several Chinese branded radios and no key presses are required for PC to Radio programming. Simply select the assigned com port, read from the radio, make changes, and then write back to the radio. The trick is the software generally only supports com 1-4 so you may have to re assign the com port in your device manager.

Hope this helps
Bill

Duly noted Bill, thanks.

I'm getting oneof these rigs for my XYL, it's already
ordered. I suspect I will get one for myself too.

Anyway, we've now christened this user group, and made the first
exchange on it. I'll raise a toast to us ;-)

I've dredged the forums, looked at the rebadged versions of this
rig on websites and info is scarce.

But it looks like it's a 3.5mm 4 pole job.

I've been in touch with 409shop in HK, who tell me this morning
that they hope to be selling the programming cables eventually.

In the meantime, there's a chance that we might not need them
if our existing cables fit...who knows.

How to change the Channel Step at BAOFENG UV-3R

Switch On Radio => Press [U/V] about 3sec, Radio will change to Frequency mode in display. Then press [MENU 9],

press [U/V] to enter the STEP, then you can switch the knob to change the Channel Step into: 5/6.25/10/12.5/20/25khz

13. First Impressions

Yahoo group: UV-3R (2011)
Date: 2011-04-30 02:46:51 UTC
From: Bill
Topic: 13 Message: 13

Received mine today.

Overall very impressed.

The radio is constructed of a lower grade plastic than other Chinese models (PX-777 or KG-UVD1P) As mentioned in the YouTube review the audio is very loud on the lowest setting.

Having said that the rig is very easy to program (offset/direction/ctcss) in VFO mode, saving to memory is simple. The menu system is very intuitive for a Chinese radio and with 2W using the stock antenna, I can hit a VHF repeater 100+KM away (3500ft above sea level).

The included instructions are also somewhat easy to follow and understand.

73s

I've got one now.

No problems with audio at all.

All meus are there for the important settings.

Took me less than an hour to familiarise myself with the rig
and get about 25 memories prog'd up with all local repeaters
and simplex channels.

Having a prog cable is not really required.

I shall be buying another UV3R soon.

Go for it David ;-)

Thanks Andy,
looking forward to getting mine, according to the tracking site it left HK on the 28th. First job will be to stick it on the sig gen/sinad meter and see what the RX is like, I'll report on here of course if no-one else beats me to it. It seems some come with 2 aerials (insects have antennae), others with one, I've got a Nagoya NA-771 I use with my IC-T8E so more comparisons to do too!

Same connector as your FT60. (What you would call a female.)

I recommend the following antenna:

http://www.409shop.com/409shop_product.php?id=102432

Seems to be the best in performance of all the dual banders
I've tested (I've about 20 handheld antennas here).

Logical to me and you.

Alas the same logic is often not applied elsewhere.

27. Cross Band Operation

Yahoo group: UV-3R (2011)
Date: 2011-05-02 10:48:55 UTC
From: Steve
Topic: 27 Message: 27

Has anyone used the programing software to actually program this little radio? I am waiting for mine to arrive and have been toying with the software. It certainly looks like the radio can be programed for cross band operation....by that I mean on a given channel one can receive UHF signals and transmit on vhf. If correct this is the same feature as my Wouxun KG-UVD1p rig.
Can anyone confirm?

73, Steve

32. Observations so far.

Yahoo group: UV-3R (2011)
Date: 2011-05-02 14:11:14 UTC
From: andyfoad@rocketmail.com
Topic: 32 Message: 32

Been playing a bit now.

1)Careful with the little slider at the bottom of the rig that allows you to take off the back of the radio to get access to the battery. There's nothing to hold it in, and it can be slid out, and lost if you are not careful.

2) I have not done a full sprog search on the receiver yet, but there's one right on 156.000Mhz. Because the're no s-meter on this rig I cannot say how strong it is. But by judgement, and by using my VX7R recieving a signal source on thos freq I'd say it's about an S5 sprog. This might annoy marine band listeners.

3)DSP. Just what is the so called DSP on thos rig ?
I note an effect on the audio when I first open up a repeater.

At first the audio sounds like the it has had some filtering applied to the audio, and hiss is reduced. But this effect seems to change afterwards. Almost like some adaptive DSP is being applied. Has anyone else further information ?

33. Re: Cross Band Operation

Yahoo group: UV-3R (2011)
Date: 2011-05-02 14:56:15 UTC
From: JoÃ£o
Topic: 27 Message: 33

Correction, it is not a crossband because crossband means that you can receive at the same time that you transmite in other band and this feature there are only a few models even the most radios that have 2 vfo not do this.
I think what do you mean is if it is possible to operate UHF in rx and when you make ptt it transmit in vhf for example to operate AO-27, AO-51 and other similar things. Yes, this it is possible to do with the UV-3R but only using the computer to program this frequencies.

Regards
João

From: Bob Parsons
Topic: 43 Message: 43

I have just got two UV-3r today,beware found a lose nut & bolt inside charger case rattling round,it wasnt they for any reason so removed.
Just give them a shake before you plug them in!
Remove sticker on charger and one cross head screw toopen charger case.
I have contatced supplier to warn to check before shipping out.

Regards

Bob

From: Ian
Topic: 46 Message: 46

Hi,

I have just uploaded a User Manual for the UV-3R for people thinking of buying one of these great rigs.

Programming:- I have had some problems connecting to the radio whilst using the serial lead - the radio switches on and goes to Tx on connection to the computer serial port on most occasions. I am using an old laptop running XP, and managed to download the default settings first before trying to load my own channel settings.

Regards,

Ian

From: Bob Parsons
Topic: 48 Message: 48

would be interesting to get a memory dump of the two versions around and compare using the software hex editor.
Newer versions coming out fro HK seem to have more menu now including Wide/Narrow select.

Bob

Hi Bob,
mine has got 18 menu options as follows;
RXCODE
TXCODE
SQL
LIGHT
BEEP
VOX
POWER
DW
STEP
OFFSET
SHIFT
STE
W/N
SAVE
TOT
SCANM
RELAYM
BCLO

One thing I've noticed that is not as manual is the charging indication, it says in the manual that the TX red LED will light during charging and the green RX LED will light when charging is complete. On my radio you just get the "standard" flashing battery icon.

Does anyone know the spkr/mic connections as I'd like to connect the audio out to my sinad meter...

Ok connections on 3.5mm 4 pole plug top to bottom

tip=+spkr
ring 2=mic
ring 3=ptt to gnd
outer ring earth

hope that helps

Bob

Think its a mis-print in maunual regarding led!
does your tone burst work when you press ptt+ F/A key on side together?
Version 2 doesnt work nor the S-meter,wondering if different on Ver 3 with 18 menus?

Bob,

Tone "brust" doesn't work with the F/A button but does work with the VOL button... The S meter works as an (inaccurate) S meter but not as a charge indicator, the little bars in the battery icon move during charging though.
Thanks for the 3.5mm jack connections.

53. Speaker/mic compatibility

Yahoo group: UV-3R (2011)
Date: 2011-05-07 00:58:33 UTC
From: Steve
Topic: 53 Message: 53

In Googling around for possible speaker mic or earpiece/mic items I get conflicting info. One web post claims VX-3R speker mic (3.5mm 4 pole)plug works great with this while the folks at 409shop claim the VX-2R speaker mic does not work with the UX-3R. Another poster said the speaker mic on his VX-6 is fully compatible(hard to understand since this plug has the threaded plug in.
Anyone have some first hand experience on this subject that can shed some light on compatibility and substitute??

55. UV3R supports reverse burst CTCSS and DCS

Yahoo group: UV-3R (2011)
Date: 2011-05-07 21:36:40 UTC
From: andyfoad@rocketmail.com
Topic: 55 Message: 55

STE, squelch tone elimination.

It works like this:

The RECEIVER needs to have Tone **Squelch** or DCS on rx.
The RECEIVER does not need to have STE activated.

The TRANSMITTER needs to have STE activated when sending ctcss or DCS.

And then what happens is when the TRANSMITTER stops tx'ing, it sends
the ctcss or DCS in reverse by 180 degrees, known as REVERSE CTCSS (or DCS).

This trick eliminates squelch tail at the receiving end.

See: http://mmi-comm.tripod.com/pl.html

Now the next mystery is the RELAYM mode.

Perhaps now we need someone with two UV3R's that have the full menu's
to test the RELAYM facility, maybe there's something in the RELAYM
mode that requires the use of two rigs to have this facility for
something else to work ?? Whatever this mode is ???

Thanks for the info Bernie.

I have looked at these two batteries, but I notice the maximum
capacity is a maximum of approx 1000mAh.

This has me thinking - is the supplied battery with the UV3R
actually 1500mAh ?;-)

Not UV4R related, but last week I tried listening for SO67
but with no success. Is it still messing about or was I
unfortunate enough to listen when no one bothered to use it I wonder.

I bet I know the answer ;-)

The FM radio only works when there is no signal
present on the VHF/UHF bands.

So if the squelch is off, noise is breaking through etc
then FM radio function will not work, and it switches back
to wherever you left it on 2m or 70cm.

Hi Andy,

the one I've got is of the cheap ebay variety. I used it in a camera and it works there fine. I know they are all cheating about capacitance, so I always have a second battery with me.

But the inner circuit of the supplied charger was a real shock, as I believe there is no electronics in the battery packs(as with notebook batteries)

He has the squelch set at 5
It does not change from fm radio , to any other band.
it just stays on fm radio , no signal , no audio after about 1 to 2 seconds.
tried radio stations all the way through the FM band , still the same.
weve even done a factory reset :(

"> Have tried charging from radio with rechargable battery in AA case works fine ."

Hi all. I just joined the group because I just ordered one of theres fine little rigs.
I thought it was awesome that you could use the AA batterie packs with this HT.
From what you are saying is that you can charge the rechargeable AA batteries while still attached to the HT? If so that to me is awesome! I hope I understood that correctly.
Thanks.

From: w2eec
Topic: 69 Message: 69

Hi all.
Does anyone know if you can use the Yaesu VX-3R programing cable or any other USB programing cable for that matter?
I have a Mac without a serial connector so I would also have to purchase a serial adapter if the USB doesn't work. I have Windows XP installed on bootcamp for a OS.
Thanks for the info in advanced.

BCLO - when on stops you tx'ing when signal is being received.
RELAYM - not known properly yet
TOT - time out timer. Cuts tx after certain period
SAVE - battery save on rx

Hi Eric
Yes charged my 2300mAhr AA cells in the VX-3r battery case connected to UV-3R ok
may need to mod your AA battery case to fit I just filled a small hole,see PICs section on here,they maybe a better method but it works fine as a quick way of checking.

From: paul20.t21@btinternet.com
Topic: 73 Message: 73

Hi I have just joined the group and awaiting delivery of UV-3r
I was just wondering has anyone found out how to switch wide to narrow fm by using a button combination, or is it only available by programming.
I downloaded the latest programming software for Baofeng but can not get it to run, probably because of chinese characters, the older version is ok, My one is coming with pc programming cable, so all i need now is a pc with serial port, anyway looking forward to using this little unit, I mostly listen and the 2 watts isn't that much of a problem to me.
cheers
Paul

Hi Paul,
you will probably be getting the current 18 menu version so quite simply;
Press MENU,
Turn dial to W/N;
Press U/V,
Turn dial to Wide or Narrow as required,
Press U/V to store,
Press MENU to exit.

75. Version 2 12menu UV-3R Wide Narrow FM work around and 477mhz CB

Yahoo group: UV-3R (2011)
Date: 2011-05-09 11:48:43 UTC
From: Bob Parsons
Topic: 75 Message: 75

I have now tried UV-3r programming software/ead from 409shop today and users in europe who need narrow deviation on VHF 2m and wide Deviation on 70cm UHF it can be done in software and confirmed.
You can set VFO to Narrow for VHF and Wide for UHF or narrow global.
Or set them channel by channel in mems.
You have to prog VFO twice if to select global Deviation on both bands ie Narrow /Narrow
Another note,when you switch to narrow nothing is displayed on UV-3r LCD,W disappears,would have thort they would put N for Narrow?

CH Display Mode Tab

controls power wake up either VFo=Freq or Memory=Ch

I tried reprogramming set to 477mhz by changing the Frequency range to 450 to 520mhz in software and programming,but it resets radio to default so no luck there yet!
Maybe hard coded into CPU or a flash or hardware link to change?
Im trying to source a service manual,Vero do have them available,but to Dealers only!

Regards All

Bob

Hey all.
I was looking around on the web and found a web page that I think is Vero (or something like that that starts with a V) and in the accessories section it showed a USB programing cable next to a serial Programing cable. I am hoping the USB version is soon to come. Just wanted to let you know what I found.
They kind of look like a company that make the radio and just rebrand it for whoever is purchasing it and wants to sell it. In the spot where the Baofeng logo would be there was a sticker with "YOUR NAME" printed on it. It looks just like the Baofeng and its model is UV-3R too.

Thanks Bob.
I just looked at the pics.
Nice mod.
on your last 3 pics posted I see you filed it differently than the first three pics. Did you have to alter anything on the HT itself? I don't have the 3R yet (it's being shipped) so I can't check but it looked like in your first 3 pics there was something sticking out where the slot was filed in the AA battery case? I just ordered two AA battery cases myself and I am looking to make the same mod as in your last three pis. Thanks for your time.

The thing sticking out is part of the belt clip attachment,just remove plastic bit and file inner AA case,hole not needed as in first pic.
No alterations to the HT needed OK

85. Re: [UV-3R] FM Radio Problem

Yahoo group: UV-3R (2011)
Date: 2011-05-11 06:18:50 UTC
From: Mike M
Topic: 59 Message: 85

Bernard -
I don't have a UV-3R yet (it's in the mail) but I do have a TYT TH-2R with the same FM feature. I think what is happening is that the squelch is kicking in, especially if you put the radio into FM mode and then set it on a table. Try lowering the squelch threshold, if possible, and see if that fixes your problem.

Programing cable arrived from 409 Shop to US in 1 week. Vendor included a CD with copy of software as well. Am using a serial to usb adapter. Plugged in the cable to WIN 7 computer and after initial com port setting the software read from the radio(had a couple channels already programed). I loaded all my channels I'd preprogramed (see files section for list)into the software then hit the "write" button and it uploaded in about 10 seconds. Can't wait to now give AMSAT birds a try. GREAT experience so far.

87. Firmware version?

Yahoo group: UV-3R (2011)
Date: 2011-05-12 00:22:16 UTC
From: w2eec
Topic: 87 Message: 87

From looking around I have seen that there was two or three firmware versions of the Baofeng HT. I think I have seen that the last version has 6 more menu options and a S-Meter on it.
If this is true, for the people who got that new firmware, what Ebay seller did you purchase it from? I got my email back from radioshop888 and he told me that the one he is selling has only 12 menus so I am looking around to see what Ebay seller gives me the best chance to get the newest firmware. Thanks to all and 73.

Try to select a freq with no activity and noise (I use now 173995).
Store this to memory in a location for example 99 and also set in this one: Rx code to DCS, Band to Narrow, Power Low.
set SQL to MAX and now try to listen the radio and see if it work or not.

i Have just received this radio this morning..ordered last saturday from g8khshop
Date on manual say april 15th 2011 and has 12 menu items listed
but can confirm it has the 18 in the radio.
It came complete with pc lead and tiny dual band antenna + 2 standard antennas and earpiece/mic
I am delighted with the quick service from hongkong to belfast in
less than 5 days.
Anybody got a good set of data for UK area.
cheers

Hi,
thank you for diagram.

I made my home made cable but with only one connection for TX near GND, between RX and TX jack pin is not connected to TX because other way is not reading correct - error at reading.
My home made RS232 to TTL interface have external power to avoid any low voltage problems from USB or RS232 and looks like it is working properly... but:

- after the program sw display read successfully press OK, when to display what it read it crash.
I tested all software I find on the net for UV-3 on 3 computers with XP-SP3 (adapter USB-RS232->cable UV-3)
and one computer with W98 (RS232->cable UV-3) and on all is the same, crash when to display what it read.

I installed also latest distribution pack for MFC42.dll from MS and the same problem.

Any idea ?

Hi

When I tested, the read procedure didn't work if I not connected the jack 2nd and 3rd contact (two middle ones).

My cable is an "old" homemade programming cable. I used this interface to programming Yaesu, Icom, Kenwood, Puxing, Wouxun ... UV-3R with a little modification (Photos/Programming galery) and change the plug.
PC: dual core laptop with serial port, XP SP3 latest patches
SW: 1.01.01 2010.10.08 (about)

I tested it with my laptop & ATEN USB to serial cable, read & write was OK...
I tested with my minimal PC (800MHz) with serial port, no other programming software used before, read & write was OK.

Hi!

If your radio has a full reset (push [U/V] + [ON/OFF], hold the [U/V] for 1-2s) and will you read the radio first time, the read will run successfully, but the program will crash... (Photos/Programming)
You need to write a saved data (file, open, xyz.dat), then the reading procedure works.
I think it is a SW bug.

Yes it looks like a sw bug, this was my problem - my cable it is ok.

Have a look at Photos/Programming I uploaded picture radio_error_009 this is how it looks STEP value in menu after uploading new data with sw... strange.
Looks like UV-3 sw need major improving; if radio is the same as the sw then we have a BIG problem.

p.s.
I bayed another jack and with that one I am not able to connect to radio using the same interface... Chinese quality...

Is that a problem with the jack? I had trouble when I made a cable for my VX-8GR. The jack bought from the component store has a wide flat circular flange (not sure if that's the right word but I don't know what to call it) at the base where the plastic sleeve screws on. It prevents the jack from being pushed fully into the socket. The manufactured ones have a narrow base that allows the jack to be pushed fully into the socket which is recessed.

I think it is the same problem.
Few days ago I did reset the radio with [U/V]+[ON/OFF] and after that I stored again my channels one by one.

Yesterday night I try to make a cable for UV-3 from my hand made FT-60 cable (I used the FT-60 china jack and just soldered another 3 wires to that jack and connected to my RS232-MAX232/TTL interface) and I try to save my data and had the sw crash after it read successfully. This happened on 4 computers I tested, XP, W98...

Today after I seen your post I program your saved data to my UV-3 radio and after that I was able to read and save - sw did not crashed at the end. I did not made again UV-3 reset after that to double check because I am 99.9& sure this is the problem, sw.

Just as a hint:
- my working hand made cable if it is connected to MAX interface & radio then PTT it is not working - if I listen the radio FM can't read the data
Better to be on freq mode not on channel stored mode !!!

Yes I think it is jack problem.
Jack head looks very little smaller that another working one.
Base where the plastic it is looks ok, I can insert it in radio.

I just did upload a picture to photo section. It is showing those small differences with 4pin plugs. Commonly available plugs like shown under No.2 may not work with our radio.

BTW: I did receive my UV-3R today. So far everything seems to work as expected, but there was a problem when trying to use one of my already available dualband antennas:
After releasing the PTT button, transmitter did not stop transmitting! This only seems to happen on VHF in case power is set to HIGH and could have something to do with antenna mismatching.

From: f4avi
Topic: 109 Message: 109

Hi all,
I'm new on this board.
I bought one of these rigs a couple of weeks ago, and another friend has received his TRX yesterday.
I have the old version, with 12 menu items and NO 1750Hz.
My friend's rig has 18 menu items and 1750Hz working.

I decided to open the rig, just to see inside.

I found the main CHIP is a RDA 1846 which is an entirely integrated IC for portable radio.
It's a true totally digital radio, with DSP inside for both receiving and transmitting.

The FM band IC, is a RDA 5802, similar to RDA 1846, but only for FM receiving.

There is a serial EEPROM 24C16 too, and I think I will try to read his content just to see if i can find something interesting.

The main processor is under the LCD display, but I didn't want to unmount it, as I'm scared for malfunction of the display after that.

I'll take some photos and send them to the board later ...

After reading this, i did remember following page:
http://rev0proto.com/wiki/index.php/Puxing_PX-2R

Here you also can find links for downloading datasheets on RDA 5802 and some RDA 1845, which could be quite similar to RDA 1846 used with UV-3R. Maybe this informations could help also finding more on type of IC used with our radio.

Hello Klaus.

This happened to me when I was using the earpiece / mic that was supplied with my radio. Like you, it happened only using high power. I could also tame it by winding a couple of turns of the mic cable on to a split ferrite. Clearly RF getting into the PTT circuit through the wire.

If it happens just with a different antenna connected it is not so good. I purchased a Nagoya NA-401 dual band antenna to use with this radio as it is very small. But it is about 3dB down on the single band VHF antenna supplied. The SWR at 145.5MHz is about 4:1. I didn't observe the problem you had despite this mismatch.

It's looking like UV-3R electronics isn't protected enough against RF getting inside, but i am quite sure, our chinese friends also will recognize and this will be solved with later versions. For me this isn't a big problem and after knowing what happens, there always are ways to do anything against it (like also mentioned by you).

No photo necessary. I just took one of those RFI suppression ferrites that open like a clam shell so it can be clamped on to a cable, wound a couple of turns of the cable throigh it close to the plug, and snapped it shut. I only did it as an experiment to try to isolate the cause of the problem. Perhaps if I had had a smaller ferrite it would have looked a bit neater.

119. Receiving on 70cm when a nearby radio transmits on 2m, or vice versa

Yahoo group: UV-3R (2011)
Date: 2011-05-16 15:55:44 UTC
From: Sivan
Topic: 119 Message: 119

Has anybody tried to use the UV-3R to receive satellites when another radio is transmitting to the sat nearby?

That is, I'm wondering whether the radio has two separate band-pass filters for 2m and 70cm, or else whether the antenna is connected directly to the transceiver chip (in which case I assume a nearby transmitter on the other band will block reception on the UV-3R).

Thanks, Sivan

I see in the manual that the step size is either 12.5kHz or 5kHz, so I think that the transceiver cannot be used for sats independently of the front-end selectivity.

use program to dump file by select Freqency Range 400-470MHz, then save as data.dat, use view EE Map (F5 key) to view address 07A3.

try hex editor to edit address 07A3, change it from 45 to 47.

I 've never tried, be carefull.

sorry for by bad english.

Actually step size includes 5 and 6.25. See list of programed frequencies in the files section of this site. Have listened to several passes but no luck in contacts. There does seem to be some sensitivity issues on receive as reception of the birds is intermittant and compared to my VX-7R and KG-UVD1p I get a fair amount of extraneous noise not to mention the occasional tx locking from rf coming through the PTT circuit. Looks like I'll wait till it is more perfected for AMSAT use

There does seem to be some sensitivity issues on receive as reception of the birds is intermittant and compared to my VX-7R and KG-UVD1p I get a fair amount of extraneous noise not to mention the occasional tx locking from rf coming through the PTT circuit. Looks like I'll wait till it is more perfected for AMSAT use

David, thanks for the comments. However I fear you may have misunderstood rational critique of a product for "slamming" it. I have 7 different Ht's including the Yaesu VX-7R, KG-UVD1p(actually founded and moderate that Yahoo group), Jingtong 2 meter, FD-150 2 meter,NKT-3R (monoband brother of the Baofeng) etc. All of these radios (some even less expensive than the UV-3R) have their pros and cons. None of them, however, lock into transmit regularly when used with the earpiece/mic. Pointing this out and seeking group input/solution enabling one to "stick in your pocket as a ......" is one of the purposes of groups such as this.

Subject: [UV-3R] Sense of reality.

Hi guys,

there have been several posts on this group regarding the problems and limitations of the UV-3R, i.e. the PTT lock up. Seriously, if you want £200 quality then don't buy a £25 radio. The UV-3R is great to stick in your pocket as a go anywhere handheld, a top of the range radio it is not...

I've been thinking about the same thing, please keep us up to date with your progress.

Looking at the block diagram on the datasheet it seems like the chip itself is pretty much a SDR.. I bet the DSP code is in ROM though, and the interface doesn't give any access to it. If the original company wanted to, they could make the chip work in SSB. The step size wouldn't be much of a problem if you sampled a large enough part of the signal at each step..

Anyways, the current chip supports DTMF. I don't know how you would implement it unless with preset memories.

I could think of a few uses for a radio that can be controlled at such a low level also. Remote station, mount on top of mast for short coax runs, more mobile-friendly interface, etc. I have the programming manual for the RDA1845 chip but it's in Chinese. I'm going to compare the two later to see if there are any similarities.

Happy hunting,
James

I agree. No-one expects state of the art performance or outstanding build quality but a fault is still a fault and it is perfectly justifiable to comment on it. The low price of the radio is reflected in users' willingness to put up with minor issues or try to seek do it yourself solutions rather than complain or send the radio back which they would certainly do if it had come from one of the established ham radio manufacturers.

Steve,
my comment could have been better worded, I was not having a go about the PTT issue as such, or the discussion on its remedy. I was more concerned about the comments of some who seem to expect more from the radio than it's designed to achieve.

As for the PTT issue, I've not dismantled my radio as I've had no need to but I wonder if a SMD capacitor fitted to the socket pins would bring about a cure, there must be room for an 0402 or 0603 size capacitor I would imagine...

133. Baofeng UV-3R have problem on RX - cut RX

Yahoo group: UV-3R (2011)
Date: 2011-05-17 19:46:17 UTC
From: luciano_work
Topic: 133 Message: 133

Today I start to see this problem:
UV-3 on RX to local repeater (UHF) aleatory start to cut the RX in the middle of received conversation for brief moment.
First I think that somebody press PTT and enter to same freq but turned on the Yaesu and no problems at all, RX it is fine and not cut, UV-3 the same problem.
I heard another person with UV-3 started to complain about the same problem on repeater, so it looks like this can be a general UV-3 problem.

p.s.
Started to play on menu and changed TX from high to low and surprise, no more problems on RX. (my UV-3 it was on Narrow, SQL on 1).

Prob your repeater is wide deviation not narrow,it will chop like mad if set to narrow,set it to wide and try again.
No probs heres and dont go by what 2m repeater plan says that they use narrow deviation a lot of repeaters are still using wide deviation,70cm band usually wide deviation unless internet gate way.

Thx for answer Rob,

I have the repeater settings stored in memory and are not changed by random access and it worked at narrow without problems for the beginning few days ago (and yes this repeater use internet gate way also) and also after I just changed in menu TX power to Low RX this problems disappeared.

I forgot to mention that this problem appeared only when I turned ON the radio and on that freq was activity so radio started to receive from the beginning.
If I remember correctly this happened also on radio FM some time ago but cured after browsed/changed freq.

I will monitor the problem if reapear.

L.

Hi,

I also didn't find the lowest volume low enough so i decided to fix it. After looking at the datasheet for the RDA1846 it seems that it cant go below -15dB which might not be low enough so I decided to change the feedback resistor on the amplifier and now it works as a charm! Wonderful just right volume.

Hey Seamus.
Glad you got yours. I am still looking in the mail every day hoping it is there. I only ordered it about 12 days ago so I hope it is soon. I want to play with the new toy :-)
Quick question for you. Where did you get your and did it have the 18 menus or the 12?
I hope mine has the 18 menus but if not I may give this one to my girlfriend and purchase another one and hope it has the 18 menus. That is why I asked where you got yours. I have been trying to keep track of who is selling them with the latest firmware on them so I can get the latest one. Thanks and have fun.

Hi Eric,
I got mine from www.409shop.com .
It has the 18 menus, though 17 (RELAYM) does still hold a bit of mystery with it!
It arrived in about 10days from Hong Kong so I hope yours arrives soon. I have ordered a dual band aerial and a spare battery too but that was only a couple of days ago.
Why do they supply two aerials with a dual band radio? Surely one dual band aerial would be cheaper to make and supply!

Happy Baofeng'ing!

From: Bob Parsons
Topic: 147 Message: 150

Well bad news guys,software takes freq from 136 to 520mhz no probs,but it looks like radio is locked in firmware Grrrrr
the file modified is the Settings.ini
rename it Settings.txt and modify as below then save rename back to ini
Use wordpad to edit,the line added is Freq 6
hope this is some use to someone?

bob

```
[Setting]
Language=1
ModelList=UV-3R,
Company=Dual-Band Pocket Radio
FreqRange=60-130
ModelName=UV-3R
ComPort=1

[FreqNums]
Number=7
Freq0=60,130,60,130,243
Freq1=136,174,136,174,244
Freq2=350,390,350,390,242
Freq3=400,470,400,470,240
Freq4=450,470,450,470,245
Freq5=450,520,450,520,241
Freq6=136,520,136,520,246

[level]
level=9
```

409shop does sell the radio with a dual band aerial if you want. I bought my radio from them (took 6 days from order to delivery in New Zealand) along with the extra battery.
The single aerials possibly have better performance than a dual band one and on my analyser they are very narrow band compared to dual band ones I have checked. I have ordered a dual band one though so I can use whatever is best for the day.
Mine has the 18 menu positions.
Transmit audio is very good and much better than many other Chinese radios I have checked. Receive audio is excellent especially considering the small size of the radio,

Grant, ZL2BK.

Subject: [UV-3R] Re: Great little radio!

Hi Eric,
I got mine from www.409shop.com .
It has the 18 menus, though 17 (RELAYM) does still hold a bit of mystery with it!
It arrived in about 10days from Hong Kong so I hope yours arrives soon. I have ordered a dual band aerial and a spare battery too but that was only a couple of days ago.
Why do they supply two aerials with a dual band radio? Surely one dual band aerial would be cheaper to make and supply!

Happy Baofeng'ing!

Thank you for sharing this solution and picture.

I did today the work and soldered a 51k SMD resistor on top of components to get final value 33k.
Because the SMD resistors I succeed to buy looks huge compared with original one, I had to solder in an unusual position and from R to R in diagonal, lucky both R have commune connection in the middle.

Some useful information:
- original resistor is 100k.
- because sometime it is hard to find exact value of SMD resistor you can try to get any value so final resistor will have the value between 29k - 40k.
- be careful if you are not familiar with SMD soldering and don't have proper tools don't try it because changes are very high that you will not succeed and will damage the radio.
- antenna connector need to be unsolder to be able to remove the PCB and do the work.

L.

I got mine yesterday from RadioShop888. It took 13 days to get to the US. It has the 18 menus as well. As others have mentioned, the receive audio it quite loud even at the lowest setting. It only took a minute to navigate the menus, setup a repeater, get on the air, and have a short QSO.

I've got a VX-3R and it still blows my mind that the form factor is exactly the same.

For you guys that already have one, this won't be very interesting, but
I've done a quick unboxing video.

http://www.brickolore.com/2011/05/baofeng-uv-3r-my-unboxing-video.html

And I walk through the menus here.
http://www.brickolore.com/2011/05/baofeng-uv-3r-menu-options-video.html

Excellent! No problem :)

To further improve the resolution one could change the output resistor from the FM receiver to a lower value since the output from that receiver is a bit lower. I didn't bother since i rarely will use the FM band anyway.

Kudos to those of you who can work on stuff that small! I wouldn't even think about it.

Fortunately there is the earpiece/mic for those of us who can't do the mod. Actually the audio level in that is a lot lower so I wonder what it would be after the mod? Putting a resistor in series with the speaker might actually be a better solution that would not affect the audio level in the earpiece.

Hey Brickolore.
Thanks for the video and the menu chart. Nice.
I just got in the mail today my notice that it is at my local postoffice and I am going to go down in the morning to get it. I hope it is the newest one with the 18 menus. I was thinking if it isn't I may offer it up to my club for a raffel to help them out with some cash to get the repeater worked on and then order one form 888 or 409 that has a track record of the newer firmware models. I guess I'll see in the morning. Time for bed.

First major fault.

XYL saw it and decides she wanted it!

Seriously. First impressions are good.

A way to change frequency quickly would be good- "dialing through" 70cm will take an age.

The two antennas is a bind, I've bought a dual band antenna but the radio should ship with one.

I was hoping to be able to use an adaptor with on of my stock of existing programming leads but have had no joy with that. The details on the pin outs are too vague to be sure what is required (I know there is a photo in the files area but would prefer a proper circuit so I can check what is going on).

I will have to order another one for myself as the XYL will be having this one I'm sure!
I'm just wondering if I should order 4 more as my daughters are also licensed.....

Book of destructions mentions a scrambler on the front but not inside.
(At least not that I can see.)

I appreciate we can't use this but I'm curious.

Is there a hidden menu somewhere, if so, what else is hidden?

In particular, I'd like to restrict the tx coverage to amateur bands only.

Just got UV-3R today.
I love it. I can't believe how small it is.
I also got the Yaesu VX-3R aftermarket AA battery case for it. The non-rechargeable batteries fit very nice and snug but some of my AA rechargeable batteries do not fit. I wonder if I got the real Yaesu AA battery case if my AA rechargeable batteries will fit then? I may order one today to see if it'll fit my rechargeables. I also noticed with my fully recharged battery from Baofeng I got 4.1 volts and with 3 standard AA batteries in the pack I got 4.7 volts.
Just after I ouder my RS-232 programing cable I see that they are now selling the USB programing cables. I think I am going to get it. I don't yet have a RS-232 to USB converter yet so sense they are both the same price I think I am going to get the USB cable and hold on to the RS-232 cable for a project or something. For now I am just programing it by hand. I do have to say that it is nice and easy compared to other Chinese radios I have seen. I have high hopes for this HT.
I don't like the external charger that much. There is no LED's telling you when your charge is done. Charging through the HT IMHO is the way to go.
I added a Nagoya NA-701 dual band anuenna and it looks and works real good. Testing is to come but everything seems good for now. Nice antennas from Nagoya for $9.00 US bucks.
I think I am also going to look for a car charger. I'm on the road a lot and it would be nice to have.
I may get a second one for work or my truck. Does anyone know if the VX-3R cloning cable works on the UV-3R's?
Now it is time to get back to programing my new toy :-)

From: Brian
Topic: 175 Message: 175

I've just looked inside the supplied charger stand. It has no electronics, it is simply a case with a "through" connection from the socket to the spring clips.

I do hope that means the "wall wart" is more than just a 5V supply, I don't believe charging Lion batteries with "dumb" charger is a good idea.

I'll wager a pound to a penny it is just a 5V supply. In fact I have an almost identical one (differing only in having a 3 pin plug and a different size barrel connector on the end) that came with some other bit of equipment.

Perhaps the charging electronics are within the battery ?

Either way, I only use the dc input jack on the radio, the cradle seems a bit pointless to me because it requires the removal of the back of the radio to charge it.

What a dumb idea.

Just recently I've been experimenting with charging Li-ION batteries with a simple 8.4v supply and a current limiting resistor on a spare 1400mah Wouxun pack. Charging current at a maximum of 400mah for a few hours.

So far so good.

I have the correct chargers anyway, so why did I try it ?

Well because I wanted to ;-)

I think they might be in the radio. The battery icon animates when charging and goes off when it is finished. I'm just testing right now charging off my bench power supply to see if the current cuts off when that happens.

I wish Vero hadn't done the nonstandard thing and made positive the sleeve of the connector. I nearly connected the cable up the wrong way round which would have been very upsetting.

To be honest I don't think you can take anything for granted when it comes to Chinese battery chargers. I bought one for a Motorola GP300. I took it apart after I spotted smoke coming out and found that the PCB was almost devoid of the components it had been designed to contain apart from a resistor going from the 12V input to the charging terminal. They hadn't even fitted an adequately rated resistor!

And I just yesterday received a 9600mAh 5V rechargeable backup battery to use for an external supply for a smartphone and the charger they supplied failed after a couple of minutes. Probably because it was rated for 200mA output which I suspect is not nearly adequate - even the UV-3R takes more than 400mA when the battery is fully depleted.

I tested charging in the radio using the side socket and the current goes from over 400mA down to a few tens of mA then when the animated battery icon disappears the charging current is cut off. Whether or not the charge control circuit is in the radio or the battery I don't know but it certainly seems safe to charge the battery in the radio.

I think I will throw the charger stand away and splice one of the connectors from the curious double ended short cable on to an old USB cable (taking care to check the polarity!) and then I could charge the radio from a PC USB socket or any mobile phone charger with a USB socket for output.

From: andyfoad@rocketmail.com
Topic: 181 Message: 182

That's it because it's a TRANSMIT function.

It works like this:

If your UV-3R is recieving a signal, then your PTT will not
allow to transmit until the signal has dropped carrier.

Hope this helps.

Nice one Julian. I wanted to do that test myself to satisfy my doubts about whether leaving the rig charging overnight was knackering the battery.

> I think I will throw the charger stand away

I haven't even bothered taking mine out of it's wrapper yet,as it seemed so pointless to be, but maybe a use could be found for it at a later date, maybe in a modified state.

In the meantime it does no harm to keep it in it's box in the cupboard...

184. Question about WFM/NFM and Dual Watch?

Yahoo group: UV-3R (2011)

From: w2eec
Topic: 184 Message: 184

Hi all.
On my other rigs most of my frequencies for repeaters are set to NFM. On my UV-3R I set then to NFM and I got this clicking noise in the background. I tried my other HT's at the same time and they didn't do that. I changed on the UV-3R to WFM and it went away. I also had to do the same for my local WX stations. At first I thought it was the squelch setting but that did not help at all. Should all my frequencies be changed to WFM just in case?
How does Dual Watch work? It states that you can scan in VFO while watching a user programed station. How is this done? I have played with it but can't seem to get it to work.
Thanks.

I think the NFM is just a bit too narrow on receive.

Because of the critical charging requirements for correctly charging Lithium type batteries it is normal to have the electronics within the battery to ensure there is no problem. These UV-3R batteries are also used in other devices such as some digital cameras which helps keep the price down.
The charging cup / stand is useful to me as I have 2 batteries. I leave one in the stand with the radio sitting in the front. However the radio doesn't sit properly if you have the belt clip on the battery unfortunately.

I haven't been in a position to check it. When I get the chance, I'll do so. There's no indication of charge state at all on the stand so I just leave it plugged in to the 5 volt supply that came with it.

189. Computer Programming the UV-3R

Yahoo group: UV-3R (2011)
Date: 2011-05-24 04:12:05 UTC
From: kd0hkd_randy
Topic: 189 Message: 189

All my prior experience is programming various Yaesu Radios, including the VX-3R. I'm also a software engineer by profession, so I'm embarrassed I have not figured this out yet.

I first tried the software from the disk, and found that my comprehension in reading Chinese is not quite up to par. I've downloaded an English version that's a bit easier to read. I've noted the Help file is non-existent, except to give a version number.

I've resolved any COM port issues, and have determined that I have the correct settings, but so far I am unable to communicate to or from the radio.

Is there a "Clone Mode" that needs to be selected, such as the Yaesu radios, or does the UV-3R simply "know" that it has been plugged into the computer?

I have the "official" cable from the vendor, with the serial plug. I've read on this group that the USB Cloning Cables do not work, but I expect a serial to USB adapter cable should work. Am I wrong?

Any advice would be appreciated! Thanks!

As I understand it, if your using a VX3R cable then it won't work. I am not aware of any clone mode on the Baoefeng.

(Unlike most rigs, such as my VX7 that needs telling to communicate).

By the way I've tried my Yaesu VX7 cable which doesn't work either on the Baoefeng, so I've ordered the correct cable for USD$10 delivered to the UK.

Not that I have problems doing a few simple keypresses in order to program memories (I do ALL mine by hand on every radio).

However I do have an old firmware version that I want to crack, so $10 is worth th eenjoyment I get from it ;-)

Yes my manual also mentions the scrambler on the front cover but I have not found one yet.

I have just done a mod to the RX VOL on mine as it was just to loud on the lowest setting for evening monitoring.

I muddled through a MOD for mine before I joined this group. I would of saved allot of time had I been here first as someone has documented it. I did mine a slightly different way.

Has anyone else got strange RX audio when the squelch first opens? The two units I have tried both open muffled and then the audio picks up the top end a few moments later.

Cracking little set for the money. Had it on the Marconi 2955 and WoW how hot is the receiver!!!! No wonder it is like a large barn door. LOL

From: w2eec
Topic: 200 Message: 200

Yesterday I went to work with both my VX-7R and the UV-3R in my book bag. When I got to work the programing was blank on the UV-3R! Back to the factory settings. Has this happened to any one? The HT's didn't get banged around to my knowledge. I have been taking my VX-7R to work with me for years and never had that problem.
Could it had been that a few buttons were pushed at the same time in my book bag and reset the radio? I don't know.
How do you do a factory reset on the UV-3R anyway?
My second question is has anyone compared the the OEM Yaesu VX-3R AA battery cover to the after-market version? I have the after-market version and it works for standard alkaline batteries but not for most of the rechargeable AA batteries. I was wondering if the rechargeable AA batteries fit better in the OEM Yaesu VX-3R AA battery case rather than the after-market battery case.
The reason why I wanted to know is because I switched to all AA rechargeable batteries in my house years ago and have not had to purchase new batteries in a long time and love it. It just seems to me more practical in the long term to run AA rechargeable batteries rather than the one's that came with the UV-3R. But that is just me I guess.
Thanks.

208. Scanning speed?

Yahoo group: UV-3R (2011)
Date: 2011-05-26 11:42:31 UTC
From: kb1ckt
Topic: 208 Message: 208

Hello all. Just came across this little radio online, and I'm intrigued by it. I don't have much use for an HT, but sometimes I'd like to have a better scanner--a scanner that can transmit would be a bonus. ;) For the most part I'm just listening to local FD, maybe highway and powerline guys; no trunked stuff. Not many active repeaters in my area, and generally I need a high power mobile rig anyhow to hit one.

That out of the way, what are the impressions of this little guy for scanning? I saw a note about the transmit not being locked for out of band (simple fix--set TX offset so that accidental TX is in band). But is it stupid slow, or have some oddities to it? My Alinco CJ-5(?) (you know, that dual band credit card radio) is a bit slow on scan--but more annoyingly, it pauses for 5 seconds and resumes scan, which is a nuisance--and it cannot be turned off.

Oh, and can the TX offset be completely variable? Say, like, program offset so that I'd always (accidentally) transmit on the calling channel? It looks like menu item 10 (per the manual) would allow that.

Thanks!

Shawn KB1CKT

From: w2eec
Topic: 215 Message: 215

Hi all.
I told several of my friends about the UV-3R and how much it looks like the VX-3R. Yesterday I went to dinner with them at an outside BBQ and sat on a picknick table while we looked them over and compared them. We did a quick test by picking some of the farthest repeaters and tried to open them up and hold a conversation. What we found on one of the repeaters was that I could access the repeater with my UV-3R but the VX-3R couldn't. Both HT's had a full battery on high power with PL tones programed in. The VX-3R had an OEM antenna and my UV-3R had a Nagoya NA-701 dual band antenna. I thought that it may be the antenna so we switched the antenna and tried the same test. Once again my UV-3R opened the repeater up with the Yaesu VX-3R OEM antenna and the VX-3R didn't using my Nagoya NA-701 antenna. I was very happy with the results and the rest of our group were very surprised especially the person who owned the VX-3R. I think 3 of them have placed orders with the same guy I got mine from. (Radioshop888) It had the 18 menu items and the s-meter.
I showed them the volume level and none of them seem to care about it.
I hope some day they put out a 5 watt version like the VX-7R or the VX-8R for a good price too. That would be real nice :-)
Have a good day all.

Bonjour ,

Pour memoriser :

se mettre sur la frequence désirée avec tout les reglages shift etc ..
appuyer F/A puis U/V
Le numero de memoire clignote , choisir celui voulu avec le dial
Appuyer U/V
C'est memorisé

Pour basculer entre VFO et memoire :

Rester appuyer sur U/V

Pour scanner (en vfo ou en memoire) :

Appuyer F/A puis MENU

Regler le shift :

Apuyer MENU
aller au menu n° 11 SHIFT
appuyer U/V , choisir + ou - , valider avec U/V

Aller au menu n°10 OFFSET
appuyer U/V , choisir le decalage , valider par PTT

1750hz

Appuyer sur VOL en etant en emission

---

l'utilisation des menu ce fait toujour de la meme maniere , la difference est en validant par PTT on sort du menu , en validant par U/V on y reste

pour regler une frequence par pas de 1mhz , appuyer sur F/A puis tourner dial (valable en vfo mais aussi pour regler le shift)

si vous avez des soucis a la reception , passez en Wide , il semblerai que le Narrow le soit un peu trop .

J'espere que cela vous aura été utile , si besoin demandez moi ..

73 !

Subject: [UV-3R] Quelqu'un parle français dans le group ?

Bonjour à tous,

je suis un peu perdu avec ce tx-rx !

- comment memoriser une fréquence

- comment scanner et afficher les fréquences mémorisées

- comment mettre une valeur au shift (600khz par exemple)

- 1750hz

voila pour mes questions ... si qq'un peut m'expliquer tout ça ?

merci d'avance.

219. Re: Baofeng UV-3R have problem on RX - cut RX

Yahoo group: UV-3R (2011)
Date: 2011-05-28 01:57:31 UTC
From: tnhorseplayer
Topic: 133 Message: 219

I received my UV-3R yesterday and I am having the same problem. Was not a problem the first day and everything seemed to work just as it should.Today though the local VHF repeater frequency started to chop really bad and I observed the same problem on several other VHF frequencies as well. Problem began as soon as I changed the squelch setting for the first time. I considered doing a reset but changed the deviation from Narrow to Wide and it seems to have solved the problem with the exception of one or two frequencies. One or two of the frequencies the squelch stays open all the way up to the 9 setting and there is nothing there but white noise but seems to only occur while in the house around other electronic equiptment. If you return those frequencies to narrow the squelch will close but the receive cuts out when monitoring the repeater. Continuing to play with it to see what I can figure out.

I had the same (what everyone is calling chop) problem on a few (2 or 3) of the repeaters I programed in for 2M. No problems on 70cm at all. A person from this group suggested change my settings from narrow to wide and the problem went away. Big thanks for that suggestion. Today I listened to the radio all day while switching repeaters on both 2M and 70cm and I had no problem with that.
It seems that this is a common problem. Once I made the change to wide everything was good and I am still on high power. This is a good thing to pass on to anyone you know that gets one of these fine HT's. I have three friends that just ordered them and I'll pass it on to them.

What I don't understand is why US hams are trying to operate on "narrow band". VERY few "narrow band" repeaters exist in the US. We are for the most part, 16F3E, which is 5Khz deviation "wideband" operation (the current definition of "narrow band" being 2.5kHz deviation). What you all are referring to as "chopping" is the normal result of a "wideband" signal going outside of the passband of "narrow band" filters. Now, "narrow band" FM is VERY prevalent in the EU and other non-US countries.

If you are in the US, unless you specifically know that a repeater you want to use is narrow band, you need to program the channels as "wideband" (not to be confused with the "wideband" of the 50's, which was 15kHz deviation.

Hey Terry.
Thanks for the info. Not trying to sound stupid but I was told to use narrow for repeaters by another ham a while back when I first got in to ham radio. I have not had any problems till the UV-3R. Now that you explained this to me, I'll use wide from now on unless there is a problem and then I'll try narrow.

224. Manuel Français / French Manual

Yahoo group: UV-3R (2011)
Date: 2011-05-28 06:36:44 UTC
From: migoisse
Topic: 224 Message: 224

Bonjour a tous ,

pour ceux qui ont du mal avec l'anglais , j'ai repris les manipulations en français , un fichier .doc est disponibles sur le groupe .

Hi to all ,
Somebody asked for info in french so i decided to make a French manual , i uploaded it to Files sections of the group .

225. UV-3R Programming Software - User Guide - Help File

Yahoo group: UV-3R (2011)
Date: 2011-05-28 10:42:44 UTC
From: ph0ppl
Topic: 225 Message: 225

Hi,

Help file is not accessible / does not show when I press index... Anyone with the same experience but solved the problem.

I there a user manual for the software that any knows?

Help appreciated.

Peter - PH0PPL

226. Dual Band antenna recommendation?

Yahoo group: UV-3R (2011)
Date: 2011-05-28 23:30:40 UTC
From: Brian
Topic: 226 Message: 226

My UV3R came with 2 antennas and, while I've bought a stubby Diamond dual band antenna as well, the performance of the latter is dreadful.

I'm after something compact (some today showed me something about 19" long, great RF wise but rather defeating the object of the small radio)perhaps, 5" or 125mm max.

What have others tried and found effective, please?

Hey Brian.
I have not tested this antenna with meters but I am using it with very nice results. It is a Nagoya NA-701. I would say it was on par with the Yaesu VX-7R antenna. I tried keying and talking on repeaters that were almost out of my range on 2M and 70cm with both antennas and I think the Nagoya just edged out the Yaesu but not by much. People who I talked to on the repeaters could not tell the difference in sound quality or on the s-meter when I switched between the two. I know it is not a real scientific way of testing but it worked for me.
The Nagoya is a bit shorter and more thin than the Yaesu and I think looks better on the UV-3R. The Yaesu antenna is 10.25" long and the Nagoya is 8.5" long.
Just my opinion. Hope this helps.

I bought the NA701 as well. I chose it because it was the shortest available other than the very short stubby ones. Seems to perform well and checked out quite well on my antenna analyser.
It doesn't receive quite as well as the original VHF antenna on the 88 to 108MHz band which is the only minor issue I found. Hardly a problem!

Yep, my preferred choice too.

Looks good, robust,right size, right performance,cheap,looks right
on all my radio's ;-)

I'm currently borrowing the original aerial from my old Yaesu VX-2r. It is the perfect size and works very well. It is actually nearly identical to the supplied VHF aerial that came with my UV-3r but is dual band.

I believe the Yaesu model number is YHA-66 and it is available as a spare part at about ?10 which seems fair until you think the radio has only cost you ?35 delivered.

There are alot of FAKE diamond stubby aerials on eBay. I have one original one brought at a radio rally several years ago that works fairly well for its size.. I have since brought several more from Hong Kong via eBay that clearley do not work. Some work on one band and not the other and further research will tell you they are fake.

I think the NA-701 is the preferred choice for budget and performance. There are also some telescopic aerials available that work well and are still fairly compact when retracted I use one of these on my scanner

hi

you could make the hole a bit bigger where the mic is,

hope this helps you out

It probably doesn't make much of a difference, but I think the VX-3R is max 1.5W when on battery vs. the UV-3R's 2W. (The VX-3R is 3W on external DC.)

There is no deviation potentiometer.

All the adjustments are made in the microprocessor. There must be a "hidden menu" which no one seems to have published details of yet.

My UV-3R was supplied with a free Diamond SRH805S tri-band stubby antenna.
It *looks* genuine but poor performance on 2m tells another story. A local
Ham radio outlet are selling the SRH805S for £29.95 - more than the cost of
the original radio!

Snip

I don't think the Base charger has any intelligence about it, unlike the built in cut off charger inside the radio. So, I would be careful not to over charge the battery unless you want an explosion!

A few months ago I did a study of several HT antennas, some of them dualbanders. I used a MiniCircuits return loss bridge and an HP E8285A test set with a spectrum analyzer to look at their match to 50 ohms.

As a result of this work I've become convinced that most dualband antannas for HTs are reasonably impedance matched on 2m or 70cm but not both. For example, the highly regarded Diamond RH77CA and SRH77CA are great 70cm antennas, but are nothing special on 2 meters. I was surprised by this, and somewhat disappointed since I own three of these!

Of the dualbanders I tested, I liked most the Smiley Model 270A, which is a telescopic tribander. It has an OK match under 3:1 on both 70cm and 2m. Just remember to change its length depending on the band (I've often forgotten to do this).

I did find that the stock dualband antenna that comes with the old Icom IC-Q7A and the new IC-T70A has a good match on 2m while on 70cm the SWR was about level at 3.4. Purchased separately, its model number is FA-S270C. The aftermarket Diamond SRH519 was very similar to the Icom.

I also tested three Nagoya antennas of mine, including the dualband model NA-773, and they all showed very poor matches. This was confirmed by poor performance on the air. Personally, I don't think this brand is worth buying, even at their low prices on eBay.

When it comes to generalizing by brand, I found that Smiley antennas were the best tuned, but most of them are monobanders. The Larsen UHF halfwave model was also very good, but also a monobander.

Of course, all the antennas I tested worked reasonably well (except the Nagoyas), so impedance match is only part of the story. But a better match means more signal gets radiated. And, of course, longer is generally better--all other things being equal.

Bottom line: I use the stock Icom that came with my IC-T70A since I use the radio more on 2m than 70cm. I use the Smiley Model 270 when out on my bicycle since it collapses to a short length that fits in a pocket and it is longer when extended. At our club's last hamfest I sold off as many of my other non-Smiley HT antennas as I could.

I've posted the my data in the Files section of this Group.

Cheers,
Andy N1KSN

Interesting. Two questions come to mind: first, were you holding somewhere around the base of the antenna when you did this? So as to simulate the effect of you? [Obviously, all bets are off for when the HT is clipped to ones belt. I recall being told once that HT design did, at least at one time, take that into effect.] Secondly, I wonder what one of those "tiger tails" (as I've heard them referred to) would do for the match. You know, a 19" length of wire attached to the radio (or 19" minus the length of the radio, if somehow clipped to the bottom of the radio). I don't know if the match would get better or worse, but I do recall reading that the wire can make a real difference.

Thanks for your interest, Shawn.

The return loss bridge is a small square metal case connected to signal ground, and when making the measurements I held it as if it were an HT, close to my head at eye level. The coax cable connections were down somewhat and away from the return loss bridge. That's as close as I think I could come to a real HT situation (using the internal microphone).

Nearby objects will have an effect on the match. I'm sure that the manufacturers make sure that the power amplifier can tolerate pretty large mismatches at the antenna.

I've built some two meter quarterwave counterpoises (tiger tails) and tested them with a field strength meter, but not in a very controlled situation. I concluded that they generally will help your signal if the rubber duck is equivalent to a quarter wavelength. A speaker mic may accomplish the same thing, since a ground connection is in the wire (but the length is variable since it is coiled).

When I built the tiger tails I put a ceramic bead (from a craft store) on the end to keep them somewhat straight. When listening to a weaker signal, the signal strength would change if the tiger tail were swinging back and forth. I tried a 70cm tiger tail, but it didn't help much, probably because it is about as long as the HT body itself.

I never tried to use an HT clipped to my belt. I don't even carry them that way, since you are likely to put a permanent bend in the rubber duck. And they would tend to pull my pants down.

By the way, I look forward to testing the stock antennas that come with the UV-3R. When I get the results I'll post them in the Files section.

SURECOM SC951 is a dud antenna.

Me and friend bought these because we also have 23cm handhelds.

Supposed to work on 2/70/23 but only works on 2m.

Nice 2m antenna, but it's a dummy load elsewhere, so here's another dud antenna to add to the list.

Sticking to my Nagoya 701, so far it out performs everything else by far.

>

I think that is an unfair generalization. I have the NA-701 which others have mentioned. It performs well in comparison with other dual band antennas of its size and is a good match on both 2m and 70cm. I think the NA-701 is probably the best choice of antenna for this radio.

I also have an NA-767 which is a telescopic high gain dual band antenna more than a metre long. Again it is a good match and gave good results in comparative tests though it is obviously unsuitable for a small HT such as the UV-3R due to its weight and length apart from being a BNC antenna.

I did buy the rarely advertised NA-401 which I thought would be a better choice for the small lightweight UV-3R as it is slimmer with a thinner more flexible whip and 1cm shorter than the NA-701 but performance was noticeably poorer possibly due to the VHF resonant frequency being around 160MHz and the SWR 4:1 at 145.0MHz.

I too have encountered the fake stubby antennas. The fake Diamond had a resonant point far from any amateur band and another unbranded one had no apparent resonant frequency at all and for all I know could be solid plastic! I do have two unbranded BNC dual band stubby antennas that are a good match on both 145 and 433MHz and perform surprisingly well for their size, about 6dB down on the short rubber duck antennas.

Wouldn't the connections to the return loss bridge act as a ground? I've done testing using a battery powered AA-200 antenna analyzer but even that is big compared to an HT like the UV-3R and I haven't found adding a 19in counterpoise makes much difference.

I found the NA-701 performs on a par with the stock rubber duck antennas from Yaesu (and better than Kenwood antennas which seem to resonate aroound 160MHz). I did find the single band 2m antenna that came with the UV-3R performed about 3dB better than the NA-701. I have not found any other antenna that size which performs that well, but it does not seem possible to find a dual band antenna that does not sacrifice performance without gooing for something much bigger.

I did find the single band 2m antenna that came with the UV-3R performed about 3dB better than the NA-701. I have not found any other antenna that size which performs that well, but it does not seem possible to find a dual band antenna that does not sacrifice performance without gooing for something much bigger.

Ignore that. I misread my writing and the comparison was with the NA-401 not the 701.

The NA-701 does perform similar to dual band rubber ducks from Yaesu. The single band VHF antenna with the UV-3R is about 3dB *poorer* than the NA-701. But it is half the size.

Topic: 255 Message: 255

Just got a new cable from 409shop.

It's the USB cable which has extensions pluggable for different rigs and conectors.

I was hoping to do a test to see if I could read the eeprom contents.

I already have a PL2303 driver installed which I use with my VX7R cable.

Main programming software refuses to see a comport !

(Tried using the drivers supplied on a mini disk from 409shop but nothing works).

Tried Control Panel and selecting a free port number but again nothing.

I'm using Win7/64, anyone else had problems ?

Hi Julian. Thanks for your interest and comments.

The ground side of the antenna was probably grounded through the coax shield to the instrument, but I don't see how this would affect the results, at least in comparing impedance matches to the antennas. And small perturbations in the holding position had minimal effects. Since the test results were consistent with my use of the antennas in the field, I am comfortable with them.

Yes, generalizing on the quality of an entire brand of antennas after testing only three different models can be considered unfair, but I think it reasonable to conclude that such a brand is at the very least unpredictable in quality and performance from model to model. (The NA-702 was particularly horrible on UHF.)

If your field experience shows that the model NA-701 performs on a par with Yaesu stock antennas, then it performs well enough to be USEABLE, as were several antennas in my study. After all, prior to the study I had used them all (except the NA-702 which was obviously horrible in use right out of the package).

My main point was that not one single dualband antenna I tested had what I would consider good matches on both VHF and UHF. This surprised me. The main consequence is that when we use our HTs, we are often using much lot less RADIATED power than we think we are.

Cheers,
Andy N1KSN

Just an update.

Just borrowed a WinXP machine and used the driver supplied
and works fine.

So it's a case of having a suitable driver that will work with
this cable on Win7/64.

Ideas anyone ?

This is the cable I use:

It's almost 90% sure to have an pl2032 or an ftdi2232, so get the drivers
for both from their webpages (Prolific and FTDI) and try them

I certainly agree with your main point. My concern was that you were suggesting that Nagoya antennas were not worth buying. I see no evidence to suggest that there is inconsistency in performnce between different Nagoya antennas of the same model which people have found to be satisfactory.

As for the ground cable, years ago I did some tests of the Miracle Whip HF antenna and claimed that it worked quite well even without a counterpoise. I had many arguments with the HF Pack group who conducted tests that claimed performance was something like 20db worse without a counterpoise. Eventually it became clear the reason for my better results was that my FT-817 was grounded through the power supply negative line which was improving the efficiency of the antenna in the same way that a counterpoise would. Therefore I would suspect that the coax connection to your test instrument could provide an efficiency improvement similar to attaching a "tiger tail". I certainly would not want to discount that possibility entirely.

Oh well, I'll play a bit more in due course.

Since I have it workingon a Win XP machine I'll use that for now.

But I don't like being beaten, so Win 7/64 must be conquered ;-)

262. Serious harmonics problem on VHF!

Yahoo group: UV-3R (2011)
Date: 2011-06-01 21:41:47 UTC
From: satellitboy
Topic: 262 Message: 262

I have made some measurements on my UV-3R.
At first I have measured the RF power with a power meter (HP 436A with a 8481A/8498A power sensor/attenuator), and the specified power is well within it's specifications on VHF and UHF (2 W high and 1 W low).
It is slightly less at all the band ends with a minimum of 1,7 W at 136 MHz, which is, of course, no problem (at least I don't have any intention to transmit on that frequency).
I was, however, shocked when I started measuring the harmonic suppression (with a HP 8591A spectrum analyzer and the 8498A attenuator):
the 2nd harmonic (on the VHF freqnency range) was only 20 dB down relative to the carrier (dBc)!
This is at the high power setting, at a frequency of 145 MHz.
The situation is even worse at the low power setting: only 6 dB down from the carrier!!!).
The situation improves above 150 MHz, and the measured 2nd harmonic is almost -75 dBc at the maximum frequency (169 MHz).
On UHF all measured harmonics are quite well suppressed (worst measured 2nd harmonic is -52 dBc).
It looks like the VHF output circuit has not been properly manufactured/designed, maybe a capacitor has not been mounted or has a too low capacitance (just a suggestion).
Has anyone made similar measurements?? I assume that I have a 'melon', but it can also be a batch in the production line that is affected.

The tests I ran did not involve antenna efficiency or radiation, only the impedance match of the antenna to 50 ohms. I do not believe that grounding would play a role here, particularly since there is a calibraton procedure to null out effects due to cables and imperfections in the return loss bridge used. Since the antennas were positioned in a way that simulates their use on an HT, poximity to other bodies was taken into account, at least approximately.

If the Nagoya NA-701 works just fine (as per your experience), great. I have no quibble with you on this. I may buy one myself. But the NA-702 is definately a total dog (as my data and on-air experience show), and two other models show poor matches, as well, so anyone listening should understand that your recommendation is for a specific model, not the brand in general.

Hi all.
I just received my Yaesu FBA-37 OEM AA battery case to use on the UV-3R.
Originally I tried the aftermarket AA battery cases sold on Ebay. They worked for alcaline AA batteries and only a very few NiMH AA rechargeable batteries.
The OEM Yaesu AA battery case fits all the different brands of rechargeable batteries I own plus from what I can tell, all alcaline batteries too.
With my experiences, I would have to say use the OEM FBA-37 AA battery cases on the UV-3R if you are planing to use rechargeable AA batteries in it. I just thought someone may make use of this info besides me.

271. Re: Baofeng UV-3R have problem on RX - cut RX

Yahoo group: UV-3R (2011)
Date: 2011-06-02 13:45:10 UTC
From: dk9de
Topic: 133 Message: 271

Dear All,

I'm having the same problem with my UV-3R latest model with the 18m menue firmware. First I thougth this is due to the deviation of the received signal. But my observation is, that even on unmodulated signals, independent from the wide/narrow bandwith, this effect occur some times. It seems, that the squelch is closing shortly and for unknown reasons.

Then I made a test with activated CTCSS on RX and found, that the problem no longer exist. Ok, that does not really solve the problem in most cases. I guess, the internal DSP in the transceiver ship is responsible for this mysterious habit. Hence there seems to be no cure.

In one of the earlier messages somebody reported, that the received audio change sometimes. If this happens it sounds like a high blend is switched on and the bandwith is reduced. Don't know, if other member of this group already made this experience, but I can comfirm that. Checking with a signal from a signal-generator I found, that at very low input levels of -120dBm the (obviously) higher audio frequencies are cut off. Seems to be a behaviour of the internal DSP as well. By increasing the input level this effect disappear.
Just for information, it does not really bother me.

Regards,
Lothar

Hey Bob.
I got the OEM Yaesu VX-3R battery case yesterday and all my rechargeable batteries fit. Most of them didn't fit with the aftermarket cases. I am going to get another OEM one as a backup. Anyhow last night I charged them in the UV-3R with no problem. Thanks.
I did have one quick question for you though. I am under the impression that NiMH and LiPo in most chargers charge at different rates. Did you do any tests on the UV-3R to see what rate it charges at?
I think on most chargers the LiPo's charge at 3.7v per cell and on NiMH it is something like 1v per cell.
After I got done charging the AA in the UV-3R, when I turned it on it showed 4.1 volts and seems to be working very good. I am just thinking about long term usage and charging of the AA batteries and there health.
In order to fit the battery pack I ground off the little metal nubs that held the plastic piece in place for the belt clip. I don't plan on using the belt clip and didn't need to use the plastic piece anymore and didn't want to leave a open spot on the back so I ordered 2 Yaesu OEM standard battery covers at I think $1.95 each plus shipping. They fit nicely with only having to remove one small bump of plastic from the OEM covers. I'll try to take some pics and post them.

Hello Andy,

I did not make that measurement because I do not have a return loss bridge (still missing in my shack...).
I am very interested in your measurement results of the 2nd harmonics.
Btw, I have ordered another UV-3R for a fellow ham and I will carry out the same measurements as soon as I have received it.
Hopefully it is an individual case and not a general problem with this handheld trx.
I will order another one for myself when it appears that the new handy is OK, it makes no sense to return my failing unit because of the shipping costs (you can probably buy a new one for the same costs).
I will keep the bad one for spare parts, or I can try to fix it (will be quite difficult with all the the small components).
However, I have made the audio modification (better volume control) without any problems.

I don't think people in general have anything to worry about. Perhaps Tom has a bad one. But using the extremely crude method of tuning one receiver to the second harmonic of the 2m frequency and comparing the strength of my UV-3R's second harmonic with that from my Kenwood TH-D72 on the same antenna I would say there is not much difference between them given the different power levels and crudity of the measurement method. Obviously I can't quote figures in dBs but I don't think anyone need worry about being received on a harmonic frequency when using their UV-3R on 2m. Certainly on its high power of 5W the Kenwood puts out a stronger second harmonic than the Baofeng does at 2W.

As for testing the impedance of the supplied antennas, I'm not sure what that has to do with the harmonic output measured on a spectrum analyzer but for what it's worth I checked the supplied VHF antenna on my AA-200 antenna analyzer and it was one of the best matches of a HT antenna I've ever seen, which probably accounts for the numerous reports of how surprisingly well it performs.

I've just done a test to compare my Wouxun UVD1P
and it's pretty much the same as the Baofeng.

It would of course be nice to see results that corraborate the
problem.

Maybe this could be a clue as to why single bamd antennas were
supplied. The narrow bandwidth acts an inherent harmonic filter.

Just a thought.

From: kenivore
Topic: 279 Message: 279

Hello all ,

i'm waiting for mine Baofeng which should arrive soon.
I've got question about FM radio broadcast range.

is there a way to go under FM radio broadcast range by programming software (on the Settings.ini file)? with which step ?

Thank for your feedback

Does anybody spotted what mcu is employed in this design?
In case it is known to more people than it's manufacturer,
it would be nice to play around with the firmware, since
there is a comm/prog provision in the schematic.

After read some discussion about volume mods that involve changing the value of feedback resistor, theres some disadvantages like the FM audio will be lower and the earphone output will slight lower. I search how to lower the volume and only affecting the speaker. Called Speaker attenuator. Theres some technique can be use. Complete schematic and calculation can be found at http://amps.zugster.net/articles/attenuation and
http://www.sengpielaudio.com/calculator-Lpad.htm
to achieve that resistor value I intend to use miniature variable resistor. This just an idea, I'm still looking the part needed

hi there

ive been messing with config file, changing the freq and you can type the freq you want as channels, put them geton the radio, but then the radio frezes when you go to the channel scan

so if anyone wants to give it ago let us know how you gen on lol

Does anyone have a recommendation of specific eBay sellers for the
Nagoya NA-701?
There are bunch of them listed and I want to be sure I don't get a cheap
imitation.

Thanks,
Mark, N8ICW

409shop.

I have three of them.

All show up a good match on both bands.

Performance is just distinguishable between the 701 and my UK
sourced Diamond SRH940.

I don't think that you will get that kind of information - even the chip itself is not labled....so it might be as well a special type designed for this radio (?)

.Hmm, I think the Japanese manufacturers tend to use Hitachi processors; not sure what a Chinese manufacturer would use. I doubt they would have issues against using PIC or AVR. Anyhow, perhaps if you go by the pinout (I think there is a schematic online?) you might be able to figure out the manufacturer, and narrow it down to a specific family.

I wouldn't be too surprised if one could flash the chip--once one finds the testpoints on the PCB. Actually, that might help narrow it down too--look on the pcb, see if there places where some flying probes could hit, that go just to the processor.

292. Re: Serious harmonics problem on VHF!

Yahoo group: UV-3R (2011)
Date: 2011-06-05 04:18:58 UTC
From: cctbcn
Topic: 262 Message: 292

I checked my UV-3R on my trusty service monitor (Schlumberger 4031) that has a feature specifically for measuring harmonics - and has been verified correct with other gear (e.g. HP analyzers, etc.) and here is what I found:

On 70cm, the 2nd harmonics were at least -60dBc at 420 MHz and better at 450 MHz.

On VHF, however, the story was different.

At 162 MHz, the 2nd harmonic was -65dBc, but just -32dBc at 144 MHz: Higher-order harmonics were adequately attenuated (better than 65 dB down from the carrier) at both frequencies.

Clearly, the folks that built the radio were serious when they specified the 136-174 MHz frequency range, but weren't quite serious enough to add an extra couple of poles to the VHF lowpass filter to to provide an adequate cutoff: In other words, the LPF had to be designed to avoid knocking the carrier down at 174 MHz with its 2nd harmonic at 348 MHz, but it has not quite enough poles to do the job at the 2nd harmonic of 144 MHz (e.g. 288 MHz) *and* still pass 174 MHz.

Careful inspection will reveal that the RF PA stage of the UV-3R is pretty simple: A couple of chokes/caps to form a broadband impedance transformation to 50 ohms, perhaps 3 caps and 2 chokes for an LPF, and then another choke/cap for the VHF/UHF diplexer.

Inspection also revealed a place for an uninstalled surface-mount chip cap, so this got me to experimenting.

Noting that the "missing" cap went from between the RF output and ground on the output of one of the coils (the other cap appearing to be in series - perhaps a blocking cap?) Going by my gut feeling (and also checking my 50 ohm filter tables) I decided that something in the 33-47 range would be OK.

Not having any 0400-series chip caps handy, I just used some small disk-ceramics and wedged it in. A 33pF improved the 144 MHz 2nd harmonic rejection (e.g. 288 MHz) from -32 to around -42dBc and actually bumped the power up from 1.65 watts to 1.95 watts.

Swapping it out to a 47pF unit resulted in the original 1.65 watts, but the 2nd harmonic (288 MHz) was now at -48dBc. At 162 MHz, the output power was down to about 0.6 watts, but I wasn't planning to transmit there, anyway!

Not seeing any other obvious places into which I could cram another disk ceramic, I stopped there, but if I were to be fanatic about it, I might have added some inductance to some of the coils.

While not quite the "better than -60dBc" that my other HT's do, the fact that a typical antenna would be nonresonant at the 2nd harmonic, I feel reasonably confident that the radiated harmonics would be quite a ways down - more along the lines of a 70 watt mobile rig with a -60dBc 2nd harmonic...

I've posted a picture in the "Photos" section of the modification labeled "UV-3R_LPF_MOD".

73,

Clint

Topic: 293 Message: 293

Hello group,

I am an owner of a UV-3R since this Friday. I got mine from an ebay shop (radiogearpro) for 37.6 GBP including (free?) shipping.
The item arrived fast and I inspected every point for failures, but I did not see any. My only complain is that the item was supposed to contain a dual band antenna, but came with 2 single band antennas instead.

Given the price, I had relaxed expectations and I can tolerate easily some of the "annoying" points.

For example, when I connect the provided earphones the audio quality (through it) is so bad and the level so low that renders the handsfree set useless.I did not try the microphone.

Other annoying things (but I can get used to them) are
- the volume drops to 0 and restores quickly during frequency changing.
- the keys (U/V,MENU, F) 99% of the times are not activated on the first press, but on the second (unless this is a feature!)

The volume control is totally annoying and I will proceed to a mod soon. The transmit quality was rated as "OK" from a test transmission and I am satisfied with that. With the included antennas I managed to open local repeaters with the Low Power settings (which I did not measure to see the actual power).

A nice-to-have thing is cross band split operation (I thought of it yesterday, when I was thinking of using it for AO-51 operation).

I am studying some articles on home made HT antennas. I personally do not care if the antenna is 10x the size of the HT when I need better performance, so I am looking towards that direction. I will post my results on the group soon.

I will also study the schematics, as I think that the device has a large capacity for both hardware and software mods.

73, Nick, SV1DJG

I'm confused.

One poster claims between 6db and 20db and now it's 32db below
carrier.

Any advance on 32db ?

;-)

Nice work! A pity Yahoo only allows you to post such small images.

I wonder if it would be possible some time for you or someone to post a step-by-step on how to get access to the board in order to do the mod so the less brave can determine whether it is within their capabilities? I've never been much good at working out how to take things apart.

296. How much power in a harmonic ?

Yahoo group: UV-3R (2011)
Date: 2011-06-05 09:45:18 UTC
From: andyfoad@rocketmail.com
Topic: 296 Message: 296

Just pondering on how much power might be escaping from
a 145Mhz harmonic.

Assuming a power of 1.5 watts and the harmonic is 32db down,
then I make that harmonic as 1 milliwatt.

Then have an untuned antenna at the harmonic frequency and you
could have almost 10db more attenuation of the harmonic.

Assuming 10db for easy maths, then the power of the radiated
harmonic is 1/10th of 1 milliwatt.

Or 0.1mW.

- Andy -

You're not the only one. One thing that accurs to me is that low pass filters give their designed performance when terminated with the proper impedance e.g. 50 ohms. Now someone testing with a spectrum analyzer would presumably have the rig connected into a dummy load but in actual use it will be connected to an antenna whose impedance at 290MHz will be anything but 50 ohms. Therefore I would have thought that these test measurements may not bear much realtion to the amount of spurious radiation when the radio is used with an antenna.

For the information of US hams, here is some text from Part 97.307:

(e) The mean power of any spurious emission from a station transmitter or external RF power amplifier transmitting on a frequency between 30-225 MHz must be at least 60 dB below the mean power of the fundamental. For a transmitter having a mean power of 25 W or less, the mean power of any spurious emission supplied to the antenna transmission line must not exceed 25 µW and must be at least 40 dB below the mean power of the fundamental emission, but need not be reduced below the power of 10 µW.

It appears that the second sentence puts a limitation on how much power can go INTO the antenna of a 2 watt HT on the 2 meter band. Twenty-five microwatts is 49 dB down from 2 watts. Ten microwatts is 53 dB down from 2 watts. The first sentence applies (I would assume) to power radiated from the antenna since it is for an "emission."

What I find curious is that I can't find a similar restriction on UHF in the same paragraph. These regulations remind me of the "Handbook for the Recently Dead" from the movie "Beetlejuice." Not written in a user-friendly style.

It seems to be that a longer press is needed, if you hold it for a
fraction of a second then it works 100%.

I suspect that the key scan speed is too low, that or the processor is
too busy doing other tasks and the interrupts are not enabled when they
need to be.

Hi Joachim,

es ist ganz klar so, dass die Buchse aus dem Transceiver "herausguckt" und die Antenne da draufgeschraubt wird. Bei den Geräten mit der anderen Buchse (wie z.B. Wouxun), wird die Antenne ja IN das Funkgerät hineingeschraubt...

Die Nagoya hat mich bisher sehr überzeugt, je nach Situation habe ich damit sogar besseren Empfang als mit den mitgelieferten Monoband-Antennen. Man muss aber klar sagen, dass für mich vor allem die Flexibilität ein Kaufargument war.

73 de Nick, DL6ER

the socket from the transceiver is outside and you'll have to screw the antenna "on it". On other radios the antenna have to be screwed into the radio ...

The Nagoya is so far very satisfying, depending on the situation it seems that I have even better reception than with the included mono-band antennas. For me, especially the flexibility of this short antenna, was the selling point.

Hi Joachim,

it is the same kind of SMA jack like on the Japanese HTs.
Received mine last week and it is a nice little rig for the price.
To be honest, it is no VX-3 clone.
If you ever had a Yaesu HT in your fingers you will see - and feel - the difference.
Apart from the lower built quality it is o.k.

Hi,

Actually, I didn't really check what the high end (160 MHz) did with the 33pF capacitor since I don't have much of an interest in transmitting there - I only checked the 47pF over the range after I was done.

* * *

One thing that I'd realized that I'd forgotten to mention after the last message (and I'm not sure why) was the "problem" with low power.

On my UV-3R, Low power was on the order of 50-100mW - plenty of power to go almost any "line-of-sight" distance.

The problem is that, as was noted previously, the 2nd harmonic is "seriously present" - in my case, it as about -10 to -15 dBc at 146 MHz - reduced to -30dBc or so after the modification. (In other words, the absolute power levels of the 2nd harmonic after modification on low and high power are *roughly* equal on my radio - that is, a few 10's of microwatts.)

If other radios are like mine, however, I would *NOT* run it on low power on VHF unless it were modified!

On UHF, the power level goes from about 1.6 watts or so on high to 1 watt on "low" power and the 2nd harmonic is about the same (e.g. -55dBc or so) in each case.

* * *

Now, exactly how LOW/HIGH power is selected is unknown for certain, but I suspect that the RD1846's "PABIAS" pin is used: This is a voltage-programmable pin (1-3 volts, additionally scaled by resistors) that is routed to the appropriate PA via Q11.

Now, twiddling the bias on FETs adjusts their gain - but it also affects their operating point, so I what I *suspect* is happening is that at very low bias for low power on VHF, the output device's impedance is seriously skewed and it happens to work as a surprisingly efficient frequency doubler! (I also suspect that, at least with my radio, the wrong bias is used - period!)

Now, it is *possible* that in the radio's EEPROM is stored a value for the "PA Bias" pin and with it, one could adjust that parameter, tweaking both the output power level as well as adjusting the PA bias to push it into a more linear range and reducing the harmonic content somewhat. This sort of thing may also change somewhat with battery voltage.

Whether or not this parameter is available via serial interface or the saved memory data (along with a number of other things) is unknown to me - but it might be worth poking around.

Remember that this *is* a bias setting and it's possible that one *could* pop a final if set too high!!!

* * *

As for the added capacitor in the picture, my guess is that it is installed at the position of "C89" (marked "NA" on the diagram) but I'd have to seriously scrutinize the board to be absolutely sure of this as I've not seen a board layout.

* * *

Finally, it's worth mentioning that the "full-sized" picture of the pictures that I took of the board can be seen if one click on the "Original" tab above and to the left of the pictures near word "View" - but this shows up only when you have selected and displayed a single picture.

311. Radio wont connect anymore

Yahoo group: UV-3R (2011)
Date: 2011-06-05 20:38:53 UTC
From: squarebanana36
Topic: 311 Message: 311

Hi i have been using the software i found on the net to connect to this radio,(the english version) and have just joined the group, to get the software you have got on here to solve the problem but it hasn't.

when i first plugged this little radio in it connected fine through com1(not usb cable) and it proceeded to read and write no problem.
then i picked the radio up and it seemed like it went on transmit itself while the programming lead was plugged in, and now it just wont connect no matter what i do, i have tried two pc's and its the same, so i am thinking its the radio, i have also done a reset on it, holding the u/v button while powering on, has anyone else had this problem please.

TIA

Alan

Well I'll be blowed !

Just checked mine.

On 2m low power gives me 140mw (High 1.6W)
On 70cm low power gives 2 watts (High gives 3 watts)

How do these powers compare with others ?

I get daft results with commercial amateur meters at the low
powers so I built a QRP power meter system good to 23cm.

I've taken great care to ensure it's accuracy through out
it's range, but I still might be wrong. Even so, I trust it more
than my commercial meters ;-)

I had a brief play with the programming software recently.

I had the same problems, but restarts etc usually cleared the
problem.

There's obviously a non fatal oddity taking place that does sort
itself out after restarts etc.

I didnt pursue it any further, as I dont have much interest
in memory programming my rigs by PC (I find doing it by hand
easy enough).

hi there

in the program there is a setting for VOX, you need to change the setting to off, that is why the rig will tx,
you will also find out that the backlight is turned off too

hope this sorts it out

thanks for the reply's
still no joy

one question in my manual it says for full factory reset hold in the f/alert button whils't turning on the receiver this does nothing for me, unless i'm doing it incorrectly, but when i hold down the v/m and power it on then yes it does reset itself of sorts to 400,000 mhz, but it still wont connect so i think it may be a partial reset or something.

Any help woudl be appreciated on this
thanks

Tom, I got my UV-3R today. While the battery has been charging I did a return loss sweep of the two stock antennas with my E8285A. The screen capture of the results are posted in a pdf file in the Files section.

The two meter antenna was resonant right at 145 MHz and the impedance match looks quite good. The 70cm antenna had its dip down just below 420 MHz and its return loss at 450 MHz was around -5.4 dB. Not a very good match on the 440 band, but useable (provided the UV-3R can tolerate SWRs around 3:1 as most HTs can).

I'll check for power output and harmonic suppression tonight or tomorrow. I plan on using 30 dB of attenuation to avoid spurious mixing products in the spectrum analysis.

Tom, this evening I made some measurements on my HP/Agilent 8285A. I've put a pdf file with the screen captures in the Files section of this group.

On two meters I got about the same results as you did, with the second harmonic 20 to 25 dBc down from the fundamental at 146 MHz on high power, and less than 10 dBc down on low power. Pretty bad!

The UHF results at 446 MHz were much better with the second harmonic down just about 60 dBc.

I hope someone comes up with a fix for the two meter band.

Hello!

It's my first message.

MCU is probably MC81F8616L from http://www.abov.co.kr/

See pinout from page 8 of datasheet:

http://www.abov.co.kr/data/manual/MC81F8816.pdf

Fits perfectly on schematic of UV-3R on files area of group.

From: brickolore
Topic: 326 Message: 326

So, in the name of science, I decided I was going to take this thing apart. I wanted to see for myself the circuit board/chips that others had posted. So after taking out some screws and separating the metal chassis/circuit board from the plastic case, I got stuck.
I took the screws out and could pull the circuit board loose, but it wouldn't separate from the metal chassis because the antenna connector, LED, and the post for the knob prevented it from coming out. Is there way to remove the antenna connector and the knob post first? Am I missing something easy? I didn't want to force it, so I didn't pull very hard.
You can see in this video how far I made it.

I've made some additional measurements of UV-3R two meter second harmonics while using an antenna. With the UV-3R 2m stock antenna, at full power the second harmonic is down 50 dB from the carrier. With the dualband antenna from my IC-T70A the second harmonic is down only 30 dBc. Given the previous results, I'd expect the low power numbers to be worse than these.

By the way, I duplicated my previous spectrum analyzer tests (power from the radio to the analyzer through an attenuator) on my IC-T70A. The 2m and 70cm 2nd harmonics were down 60 dBc or better, and were quite hard to see on the display.

I do not know about other people in this group but I recently joined and I am waiting for my UV-3R to get here and you guys are talking way over my head. Does the difference in harmonics hurt the way the radio performs? In easy terms can you tell us why it is bad? Thanks.

Subject: [UV-3R] Re: Serious harmonics problem on VHF!

I've made some additional measurements of UV-3R two meter second harmonics while using an antenna. With the UV-3R 2m stock antenna, at full power the second harmonic is down 50 dB from the carrier. With the dualband antenna from my IC-T70A the second harmonic is down only 30 dBc. Given the previous results, I'd expect the low power numbers to be worse than these.

By the way, I duplicated my previous spectrum analyzer tests (power from the radio to the analyzer through an attenuator) on my IC-T70A. The 2m and 70cm 2nd harmonics were down 60 dBc or better, and were quite hard to see on the display.

It is not good because these harmonics are transmissoins on a frequency outside the amateur band (for example the second harmonic of 145MHz is 290MHz) which could theoretically interfere with another radio service.

These harmonics are still very low power signals of the order of one thousandth of the main signal, so the 290MHz harmonic would be around 2 milliwatts. Add to this the fact that you are probably using an antenna that is not designed to be efficient at 290MHz and that signal is not going to get very far, probably no more than about 50 feet.

What that means is that there is not much chance of causing interference to other non amateur radio users if you are using the UV-3R in a built up area using a typical small inefficient antenna. But there is still more of a chance of this happening than if you were using a Yaesu or Icom radio that has better harmonic suppression. If you are operating close to a commercial antenna that receives on that frequency then there is more of a chance that the spurious signal could be heard.

My assessment of the problem is not to worry too much about it. Hams have been building and modifying equipment for years without having the equipment to measure the harmonic output with the degree of accuracy that has been done here and there have been very few cases where a problem has been caused.

If you did factory reset then you can't read from radio, sw will give error at the end of reading - this is a sw bug/feature.
You have to write first some file you can get from group and after that you can read/write properly from/to UV-3.

Hello Andy,

Can you describe how you have measured the spectral response using the 2 m stock antenna on the UV-3R with your spectrum analyzer?
I assume that you have used a broadband antenna like a discone or logperiodic type connected to the SA.
I do have a logper for VHF and UHF (leftover from an EMC accessory kit from HP) so I can try to make a similar measurement (although not very accurate, I don't have a large space free of reflecting walls, etc).
I can make the measurements with a '2 m only' antenna and a 2 m / 70 cm dual band antenna which I use with this UV-3R.

Thanks anyway for sharing your measurement results!

73's, Tom PA2TSL

Hi, this is my first message too :D

you could be right, Luciano. As delivery of my UV3R unit seems to be a bit delayed I cannot verify this in hardware, but the schematics look promising. Maybe anyone has got the ability to check; Abov has a disassembler available too - see http://www.abov.co.kr/eng/tool/choice_dr.php. If it is really the MCU you discovered, one should be able to read out the ROM, after a quick datasheet-check I assume there is no write or read protection. But I may be wrong.

I was wrong. According to http://www.abov.co.kr/data/manual/MC81F8816.pdf, Page 130 (Page 136 of 160 in the pdf) there is indeed a security bit which can be set. I have no clue if our chinese friends set this bit.

Why are you all doing ? What harmonic are you refering too? What frequency is it . It may just be local at your place. What is MCU? Why tear the radio apart? What do you expect for a $40.00/$50.00 US dollar radio?

Spence

From: andyn1ksn
Topic: 262 Message: 340

Tom, my measurement of the UV-3R spectral response through the stock 2m antenna was only a "quick and dirty" run with a non-resonant whip attached to the SA in a basement room (my "lab" and shack). I didn't send in a screen picture of the result for just that reason. As you point out, the receiving antenna on the SA could be band-selective, and the room effect is uncontrolled, with reflections, etc.

My results in the pdf files were made with a Rhode and Schwarz 30 dB attenuator (a very nice unit good from DC to 2 GHz) and an Andrew Heliax jumper from the attenuator to the SA. So I think they are valid, especially since they agree with your results.

I am very disappointed that the 2nd harmonic on two meters is so high.

73,
Andy N1KSN

From: andyfoad@rocketmail.com
Topic: 262 Message: 341

Well in my lunch hour at work I did the mod.

In my case I opted for the 33pF, as I felt it would be dual purpose,
giving me a small power boost on 145Mhz as well as another 10db
harmonic attenuation.

Easy enough to do, but it's a real pain in the butt getting the
sma connection lead back assembled. (This deserves a proper
write up later). NOTE! Read what others have said about having to unsolder from the PCB to get the pcb off the chassis !!!!

I used a leaded 33pF for the mod.

Just as Clint noted, harmonic is reduced and power starts to dive
on the HF end of the rig. Not a problem, as I have no interest
in transmitting out of the 2m amateur band anyway. Power output
starts to slop down after about 150Mhz. I have not measured what
the actual power output is yet, as I have no test equipment at work.

I did a test before the mod.

A friend monitored my 145Mhz harmonic from 200 yards away and the signal was weak with smooth hiss on it. (No s-meter)

After the mod the harmonic has gone into the noise.

On air tests on 2m/70cm repeaters just to checks no screwups
revealed all to be working as it should do into several weakish
repeater, so if there was a problem it would show up easily.

In due course I'll provide othe rinfo that may be of use.

> chip cap, so this got me to experimenting.
>
> Noting that the "missing" cap went from between the RF output and ground on the output of one of the coils (the other cap appearing to be in series - perhaps a blocking cap?) Going by my gut feeling (and also checking my 50 ohm filter tables) I decided that something in the 33-47 range would be OK.
>
> Not having any 0400-series chip caps handy, I just used some small disk-ceramics and wedged it in. A 33pF improved the 144 MHz 2nd harmonic rejection (e.g. 288 MHz) from -32 to around -42dBc and actually bumped the power up from 1.65 watts to 1.95 watts.

>
> Swapping it out to a 47pF unit resulted in the original 1.65 watts, but the 2nd harmonic (288 MHz) was now at -48dBc. At 162 MHz, the output power was down to about 0.6 watts, but I wasn't planning to transmit there, anyway!
>
> Not seeing any other obvious places into which I could cram another disk ceramic, I stopped there, but if I were to be fanatic about it, I might have added some inductance to some of the coils.
>
> While not quite the "better than -60dBc" that my other HT's do, the fact that a typical antenna would be nonresonant at the 2nd harmonic, I feel reasonably confident that the radiated harmonics would be quite a ways down - more along the lines of a 70 watt mobile rig with a -60dBc 2nd harmonic...

From: cctbcn
Topic: 262 Message: 342

Well, I'm glad that what I did was at least reproducible!

Figuring that someone else had (or soon would) shown the way to disassemble the UV-3R, I left that portion out of my missive - but at the risk of redundancy, here it is again:

- Set down a piece of cloth on the workbench to capture screws and prevent the front panel and display from being scratched.
- Remove belt clip
- Remove antenna
- Remove battery cover and battery
- Remove screw on the knob and pull off knob from the rotary encoder.
- Remove orange silicone washer from around antenna connector.
- Remove the two screws in the battery compartment. Note if they differ from each other and which one went where!
- Lift out the rubber flap that covers the DC and Mic/Speaker connection.
- Lift the bottom of the radio out of the case very carefully. It should go straight up until it clears the case and at that point the portion with the PTT/alarm/light buttons on the side should clear the case. At this point, slide out the radio chassis from the top hole that has the knob.
- Note that the speaker connects with springs to the circuit board. If they are bent noticeably, remember to (gently) straighten them before reassembly.
- Remove the nut from the rotary encoder.
- Remove the four screws holding the circuit board: There two near the lower-middle of the board and also two just above the display.
- With the display face-up, there is a solder connection to the SMA connector near the connector itself on the circuit board. While gently lifting up on the bottom of the circuit board, apply heat. The center pin of the SMA connector should easily pop out when the solder is melted. Note that lead-free solder is used, so you'll have to turn up your temperature-controlled iron to a higher temperature.

Once the board was removed, I alloyed the lead-free solder in the hole where the SMA connector was with "leaded" solder and removed it - a process that I did twice. With old-fashioned leaded solder, the working temperature was lower and the eutectic mixture was more favorable to working and then I cleaned the hole.

When testing the LPF mod, I simply dropped the board back in putting in only the top two screws (those being necessary for RF grounding) and I didn't need to resolder each time: The center pin of the SMA made adequate (temporary) connection for the testing without having to completely reassemble the radio each time!

* * *

I also (mostly) reverse-engineered the UV-3R memory map. Unlike previous work with the FT-817, I didn't have to write my own program as the UV-3R program includes a handy function that shows the EEPROM map *and* changes that have occurred if you modify a

setting. Using a normal HEX editor program, it's easy to figure out where the header is and make "additional" changes if necessary - although it's possible to make some changes that cause the PC program itself to crash when you load the memory map!

The upshot of this is that there does not appear to be any obvious place in there where other parameters may be changed, such as the amount of audio deviation, PA bias (to effect setting of the High/Low power and, to an extent, the harmonic content.)

If such values are stored in nonvolatile memory, they are either hard-coded into the program or are located in EEPROM on the processor itself and aren't readily available with the supplied program - unless there's a "Calibration menu" available that can be brought up in the radio that I don't know about...

From what I can tell, the ONLY on-board adjustment is frequency trimming: There's a small potentiometer that adjusts the VCXO tuning voltage - but I've not touched that since my UV-3R is just 300 Hz high on 70cm - hardly enough to worry about!

73,

Clint

BAOFENG LPF MODS BY ANDY G0FTD

After reading KA7OEI's info on the UV3R Yahoo users group
I decided to opt for the 33pF mod as Clint reported that
on 2m the power output was raised a little whilst providing
and extra 10db harmonic reduction.

The 47pf mods keeps the power the same on 2m but add about 20db
extra harmonic reduction. Since I felt the -42db was enough,coupled
with using an untuned antenna at 288Mhz which could potentially
add another 10db attenuation, then a harmonic now being a fracton
of a milliwatt seemed okay given it's working environment and
lack of potential to cause any problems.

CONCLUSION

Power output does appear to be raised and certainly brings the
rig in spec. Low power settings are a little odd and appear to be
reduced ! Oh well, not too bothered anyway as the low power
setting in my measurement before the mod seemed low in the first place.

So far a quick check reveals no oddities have occured to the 70cm
performance.

Here's the measurements I took, low power in brackets.

136 = 1.43 (10mW)
140 = 1.72
144 = 1.85 (40mW)
145 = 2.15 (50mW)
146 = 2.15 (60mW)
148 = 2.34 (110mW)
150 = 2.54
152 = 2.75
154 = 2.75
156 = 2.97
158 = 2.97 (670mW)
160 = 2.54
162 = 2.34
164 = 1.96
166 = 1.72
168 = 1.46
170 = 1.22

172 = 0.92
174 = 0.88 (670mW)

Can anyone collaborate the power measurements ... Clint ?

From: squarebanana36
Topic: 311 Message: 346

Hello Luciano,

I have tried 3 computers now all with the same problem, i have done factory reset,(on,off switch + vfo switch) and also without resetting, software as well,it still just says radio cannot connect, changed com port, tried all types of reset by pressing all types of buttons plus power on/off at the same time still nothing, i think ive fried something in the radio to do with the programming, or i am not resetting it properly.

When i do a reset it bleeps, when it turns on and resets the freq to 136.000 or 400.000 so it hink it is resetting. Also when i have it connected via the programming lead (which is a bought one and did work) it resets itself and the voltage comes on the radio screen and it restarts after 10 or so seconds after i have clicked connect and it says it cant.

thanks
Alan

A comment or two about the emissions from the UV-3R.

It's worth noting that - as of a couple of years ago, anyway - that for amateur radio gear, the FCC didn't actually require that harmonic suppression be a condition to be sold in the U.S. It's also worth noting that for amateur radio use, "Type Acceptance" really doesn't apply!

What they *did* check was that the emissions from the local oscillator, CPU, etc. were at appropriate levels - just as one would for any ordinary electronic gear sold in the U.S. that *may* radiate RF - that is, Part 15 standards.

* * *

Pretty much since the beginning, it has been up to the U.S. amateur using the piece of gear to avoid causing harmful interference and to obey the rules spelled out in Part 97.

As it turns out, except in the case of external amplifiers, there's little to be said about what standards the manufacturer MUST follow to sell amateur radio gear, aside for phrases like "...good engineering practice."

As noted before, for <25 watt radios operating in the 30-225 MHz range, §97.307 says:

"...the mean power of any spurious emission supplied to the antenna transmission line must not exceed 25 µW and must be at least 40 dB below the mean power of the fundamental emission, but need not be reduced below the power of 10 µW."

It's a bit awkward to parse the above rule, but I would interpret it as meaning that even with a 1 milliwatt transmitter, the 40dB rule applies - although this is a bit contradicted by the portion that says"...need not be reduced below the power of 10 µW." which, at 1 milliwatt, would mean just -20dBc or rejection!

Taking the more liberal interpretation in the paragraph immediately above (e.g. the 1 milliwatt example) my modified UV-3R would be really close to the margin on high power (1.6 watts) with the 2nd harmonic being at -48dBc. (Taking -48dBc at 1.65 watts, it would be 26 microwatts.)

On low power, the RF output power on 2 meters is around 60 milliwatts with the 2nd harmonic being around -30dBc. Rounding up to 100 milliwatts, this would mean that the 2nd harmonic was actually stronger - 100 microwatts!

Practically speaking, neither situation from a modified radio is likely to cause any harmful interference - especially since it is likely that the antenna won't radiate very well at the 2nd harmonic, anyway.

Now, the question might be asked "How are we supposed to know if our radios aren't meeting the specs in the rules?" Part 97 doesn't actually answer this, directly, but if the FCC were to knock on your door as a result of a complaint from the government users of the frequencies on which the 2nd harmonic may be found (which, as you would know, would very

nicely carry your transmit audio at twice the original deviation!) you aren't likely to get a ticket, but you would be asked to either not use or fix the equipment that is causing it.

Since most amateurs nowadays simply cannot do the latter, the former (to quit using the gear) would be the only choice.

Interestingly, now that this problem has been discussed in a forum that can be easily found via search engine, the excuse of "I didn't know..." holds a bit less weight than before, and the phrase "caveat emptor" is a bit closer to the fore!

It should also be pointed out that if any radio - even one that meets the specs in the rules - causes interference to another licensed entity due to its spurious emissions, it is up to the one doing the transmitting to fix it, even if it is "meeting specs" - even if it means that that radio can't be used anymore at all!

(Hey, that's just one of the conditions of our license!)

* * *

On the "Above 225 MHz" frequencies, you'll note that there aren't any specs in the amateur rules other than equipment must be constructed according to "good engineering practice." This admonition is in part C of the aforementioned rule and is the default "catch-all" to cover those situations not specifically spelled-out in the rules that follow it.

Practically speaking, the rules for commercial gear are typically applied (e.g. at least -60dBc - or whatever it is these days...) but what that essentially means is "Make it as good as you can, but be prepared to fix it if you cause interference!"

* * *

FWIW, I also tested the UV-3R for "other" spurious emissions on both transmit and receive. The ONLY non-harmonic emissions that I could spot at levels above -70dBm were harmonics of the 13 MHz reference oscillator on the main RF chip - and these were pretty far down - which, interestingly enough, don't seem to be readily audible on the receiver.

As far as LO emissions from the receiver, I cannot detect anything above -70dBm - which was as "low" as I looked.

For all practical purposes, this radio has a "zero hertz" IF because it essentially uses direct conversion (in quadrature) to convert to "baseband" (essentially audio) where it does the magic to demodulate the signal - and since this is all done on-chip, there's very little opportunity for these signals to leak ou: Not only that, there's a stage of RF preamplification between the chip and the antenna to add even more isolation!

* * *

Final comment, unrelated to the above. I couldn't help but notice the programming pads to the right of the display, visible in this picture:

http://groups.yahoo.com/group/UV-3R/photos/album/1332716473/pic/396513126/view?picmode=original&mode=tn&order=ordinal&start=1&dir=asc

I suspect that once someone figures out for certain the MCU being used, the use of those pads will come in handy...

Clint, thank you very much for the instructions on disassembling the UV-3R. They were just what I needed to try the low pass filter mod.

I installed a 47pF NPO cap and got similar results, namely:

144.6 MHz 33.26 dBm (2.1 watts)
289.2 MHz -11.02 dBm, or -44.28 dBc

145 MHz 33.12 dBm
290 MHz -12.4 dBm, or -45.52 dBc

146 MHz 33.09 dBm
292 MHz -14.46 dBm, or -47.55 dBc

I checked power out on UHF and found:

446 MHz 32.99 dBm
892 MHz -26.5 dBm, or -59.49 dBc

All measurements were made with an HP/Agilent E8285A and a 30 dB R&S attenuator connected directly to the radio.

Desoldering the antenna connector was fairly straightforward. I removed most of the solder with solder wick before separating the board from the chassis while heating the connection. My iron was at 400C/750F. I had one heart-stopping moment when one end of the coil lifted a bit from the pad, but I got it all back in.

Again, many thanks.

Hello Wolfgang.

So, I'm also waiting for my UV-3R arrive. Meanwhile I am looking for any literature on it.

The future looks promising.

If the MCU by a case is not locked and we can read its contents, will be very interesting to do some hacking. >:D

> you could be right, Luciano. As delivery of my UV3R unit seems to be a bit delayed I cannot verify this in hardware, but the schematics look promising. Maybe anyone has got the ability to check; Abov has a disassembler available too - see http://www.abov.co.kr/eng/tool/choice_dr.php. If it is really the MCU you discovered, one should be able to read out the ROM, after a quick datasheet-check I assume there is no write or read protection. But I may be wrong.

Ahh ... I just forgot to two details.

1) Who was appointed the MCU correct my friend Luiz Filipe Rossi

2) The discussion to find out which MCU has been started on that list PICLISTBR (googlegroups or www.piclistbr.org) by myself.

I really want to buy one of these, but I have a few questions before I go through with it. It will mainly be used for 2 meter ham. I have an older Azden mobile for higher powered operation, but I'm looking at getting a Baofeng as a backup during storms when the power is out.

First thing, how does the radio perform as a dual-band radio? I know some of these Chinese rigs can be kind of odd with dual-band operation. Can you just program all of your VHF and UHF frequencies in, side-by-side, or are there separate UHF and VHF modes that you have to switch between?

Second, I know the range of these depends almost entirely upon terrain and the antenna being used. I have a small 2 meter moxon directional beam that I use with my 2M mobile. If I hooked the Baofeng to this antenna, would I get any kind of range with it? I know that's hard to answer, but has anyone had any kind of experience hooking this rig up to a base antenna?

Third, does the radio support alpha tags? If it does, can I do it from the radio, or does that require a usb cable?

And finally, how hard is it to program the rig by hand for a repeater?

Thanks for the help. Hopefully everything will work out and I'll be able to order one in the next few days. Looking at ordering from Radioshop888 on ebay.

Lots of shops on eBay. Shop around. There's some "409" shop that seems recommended.

Radio is SMA connector; you will need an SMA to BNC, or SMA to (SO239 or PL259, forget which, not sure if they make one, so might have to be SMA to BNC, then another to SO-239). Any gain antenna will help. But elevation is your friend on 2m. If you can, run the best coax you can afford as high as you can, and put the antenna there.

On 2m you can easily make some omni directional antennas, or buy some vertical beams. J poles are decent non-gain antennas; you might be able to make a Super J to pick up some gain. I think MFJ might have a decently priced 3 element 2m beam, don't remember now. But that SM connector is going to be weak, if you put a bit SMA to BNC connector, followed by a BNC to SO-239 connector. [I once broke off the SMA on an FT-50, when I sat on it -- it had the SMA to BNC adapter on it, since I was swapping between belt usage and car usage. Oops. Expensive mistake.] Also, RF connectors are not designed for hundreds of mate-unmate cycles.

Best distance on 2m for me is probably 25 miles. Either mobile, using 5/8 wave antenna to a repeater on a tower; or while on a mountain. It's all line of site, really. If the curvature of the earth, and/or lots of other stuff gets in the way, then all bets are off. Years ago, I recall working 5W on 2m in the car, on 5/8 antennas; we were hard pressed to go much more than 5 miles or so (maybe it was 10, been too long).

I do not have one, so I can't look; but I believe it's 5V input, while most power supplies that hams use are 14V. Not a huge deal to regulate down, for car usage, or other usage. But I've kinda shied away from using HT's for anything other than portable, unless if power consumption is a big to-do: mobile rigs are just so much better at 50W, and ergonomics-wise...

*****I have never used it with a base antenna but my dual band Nagoya NA-701 antenna works real good. I hooked up another antenna that I had, it is a dual band latter line J-pole for 2M and 70cm. As you would think I received better and transmitted better so along those lines I would think a base antenna would work better. Remember it is only 2 watts.

>

>
> My assessment of the problem is not to worry too much about it. Hams have been building and modifying equipment for years without having the equipment to measure the harmonic output with the degree of accuracy that has been done here and there have been very few cases where a problem has been caused.
>

Since the radio is designed to TX over a Broadband of 136-174 Mhz the filter would would be designed to meet its spec around the average peak output of 155MHz. It would be impossible to cater for all freqs without some sort of adjustment, unless it was designed for spot freq useage. Thats just not going to happen in the price they are being knocked out at in such a broadband range.

We are talking about flea PWR here from the radio, if it was a few Hundred Watts one was dishing out I might get a bit worried about Harmonics, but not worth ripping this radio to bits in this case.

So I agree with the above it is nothing to worry about.

One at a time. It can't listen on two bands at once, for example.
You can programme a mix of VHF and UHF frequencies into memories and flip through them quickly.

>
> Second, I know the range of these depends almost entirely upon terrain and the antenna being used. I have a small 2 meter moxon directional beam that I use with my 2M mobile. It is a 2W handheld. It will be much the same as any other 2W handheld with comparable antennas and in comparable conditions.

> Third, does the radio support alpha tags? If it does, can I do it from the radio, or does that require a usb cable?

No Alpha tags.

>
> And finally, how hard is it to program the rig by hand for a repeater?

Actually, surprisingly easy considering you don't have a key pad. I didn't have a programming lead at first so had to program by hand. Due to a stroke, I don't always have good dexterity in my right hand but didn't have any problems. You can probably program a repeater in about 30s or so.

> Thanks for the help. Hopefully everything will work out and I'll be able to order one in the next few days. Looking at ordering from Radioshop888 on ebay.
>

I'm pleased with the Baofeng and I'm glad I bought it but I'd not recommend it as a "main" or serious hand held- to me it is more of a gimic / nice to have. It is very cheap and good value but quite limited. For a more serious, but economic, handheld, I'd suggest the Wouxun KGUVD1P (or similar).

Yahoo group: UV-3R (2011)
Date: 2011-06-08 21:21:10 UTC
From: cctbcn
Topic: 262 Message: 363

The "harmonic" problem boils down to one main problem: Too-few poles in the output lowpass filter.

Thinks of it this way:

It needs to pass 136-174, but that implies that the cutoff frequency for the lowpass needs to be quite a bit higher than this: With broadband circuits such as this, it has less to do with designing something to peak in the "middle" somewhere - say around 155 MHz.

For an example, suppose that the 2nd harmonic of the "raw" RF power amplifier (without a filter) was -20dBc. So, in order for the total harmonic content to be -40dBc, we need to design our filter with at least 20dB of rejection at the 2nd harmonic.

At 174 MHz - the highest frequency at which the transmitter would operate - it needs to offer 20dB of attenuation at 348 MHz, but for operation at 136 MHz, we need that same amount of attenuation at 272 MHz.

Suppose that we use a 5 element lowpass Chebychev filter (3 caps, 2 coils).

In looking at a handy filter table, I see that a "typical" 5 element filter that has 20dB of attenuation at 348 MHz would have just 3dB of attenuation at 230-250 MHz but have a cutoff at 180-200 MHz. As you can see,it wouldn't meet specs for the 272 MHz 2nd harmonic of 136 MHz where it may have, perhaps, 6-10dB of attenuation.

Now, supposing that we chose a filter with a 20dB cutoff at 272 MHz instead. For this, the 348 MHz harmonic would be fine as it is well above the cutoff point, but 3dB point would be around 200 MHz and filter would be starting to cause VSWR problems at just 150 MHz - making it more or less useless at 174 MHz.

By adding the 47pF capacitor noted in my previous email, I suspect that I'm closer to the above (latter) case than the former - that is, it's OK on the ham band, but terrible at the high (170 MHz) end.

Using a 7 element filter instead, we can see that a filter that is designed to attenuate 20dB at 272 MHz would have a cutoff in the area of 200 MHz (and a -3dB point at around 230 Mhz) - but it would leave 174 MHz more-or-less alone.

So, in other words the Baofeng folks could probably go a very long ways in fixing this problem by adding just one more inductor and capacitor!

* * *

Now, the "low power" problem is something else. Since there doesn't seem to be a way to tweak the FET bias in a "calibration" menu, I'm guessing that the wide difference that is seen between peoples' radios on low power has to do with the normal variations in FETs and their cutoff voltages: With a "fixed" bias voltage set for all radios in firmware, some will naturally be biased differently - and for FETs, biasing effectively affects both gain and the operating point (e.g. amplifier class.)

I suspect that at high power, the output FET is biased fairly heavily - probably running a "well-biased" Class C or more. At low power - with lower bias - I suspect that it is very lightly conducting and that its output impedance is radically different, wrecking the filter matching if not just producing a far-higher harmonic content.

* * *

Now, about the point of "flea power" spurs not hurting anyone, that may practically be the case with a UV-3R on high power (harmonic being -30dBc) on a rubber duck, but if one were to connect it to a "real" antenna and run low power with its observed -6dBc spurious level, having 10's of milliwatts of 2nd harmonic power *will* cover quite a distance: With a J-pole, it takes only a couple of milliwatts to put a full-quieting signal into a well-maintained repeater at 10-20km line-of-sight distance!

Personally, *I* wouldn't risk it which I why I "fixed" my radio.

* * *

I suppose that the better thing to do would be to contact the folks that made the radio (which appears to be "Fujian Nanan Baofeng Electronics Co., Ltd.") and "ding" them a bit about the 2nd harmonic problem. Since they *did* update the firmware in the radio, one might think that they'd be at least a bit proactive!

Has anyone worked out what the alarm function is supposed to do? It appears just to cause a dead carrier to be transmitted on the ccurrent frequency untill you press the PTT to stop it.

When you have BEEP enabled it also lets out a wailing noise from the
speaker.

hi there
you must have a faulty unit,, because when i have my beep on, my rig will only beep when i press a button,
I have toneburst for when you want to open repeaters, but the tone doe's not have to be on, to work that,,

Thanks, Dom. Disabling BEEP was probably the first thing I did! I wouldn't exactly call it a wailing noise, more like somebody playing scales up and down very quickly.

From: bob_nelson_k2qpn
Topic: 378 Message: 378

I just received my UV-3R. Radio looks OK. My problem is with the charging. I tried to charge a battery in the charger stand and the wall wart smoked.....got real hot and smelled real BAD! Now it has no output. I tried another 5v 1amp wall wart and discovered that the center pin of the charger stand socket goes to the negative pin of the battery and the outer pin goes to the positive pin of the battery. (My second wart has center pin plus)

CAN SOMEONE CHECK THEIR CHARGER AND TELL ME IF THE CENTER IS PLUS OR MINUS. Soon I hope. Got make a decision on whether to return the radio.

Secondly, the book says that the UV-3R should indicate charging by having the TX led red and the S meter indicates amount charged.......true or bogus? Mine did not indicate anything and did not seem to charge.

Yours in patient hope of good news..........

Dominic is correct about the polarity.

I didn't have any trouble with the wall wart that came with mine (not that I can find it now) but I spliced half the short cable with two plugs on it that came with mine onto a spare USB cable (the outer two wires are 5V, check the polarity with a meter) so now I can charge the radio from a computer or any 5V USB type wall wart such as seem to be breeding in one of my shack drawers.

The radio takes 400mA or so if the battery is run down, so some of the weedier USB chargers may not be up to the job.

Julian,

There are some other radios which have this feature. Yaesu FT60 has a similar feature. I am not commenting on the practicality of the feature. If one is a thru hiker on the Appalachian trail and yi=ou become injured and cannot move/are disabled, it would become another tool in the tool box (in addition to a signal mirror to obtain help). Presumably the carrier would bring attention, especially if it were on a repeater frequency. It would hopefully bring ot the folks with the direction findtng gear. Cell phone coverage is not available in a number of areas where one is likely to hike in New England. I know for certain in NW connecticut, there is not a lot of coverage.

Thanks for all the info guys. I reversed the polarity of my wall wart and the radio charges. The little battery indicator shows that it is charging. Now to make the reversal permanent and test the charging of the spare battery.

My vendor, radioshop888, agreed to replace the charger if I ship the old one back. I'll see how much that costs.

From: bob_nelson_k2qpn
Topic: 384 Message: 384

Since the UV-3R has a positive ground, I wonder how the mobile power adapter handles a grounded antenna? After the smoke clears you can continue to drive.

I had that happen once long ago. I was driving a 1959 Triumph TR-3 in the early 1960's. I had a 6 meter halo on the back and the rig was a Heathkit Sixer. I had the Sixer strapped to the passenger's panic bar. I was driving down the road and something shorted out and burned up the power cable. The car filled with smoke. I had the top up. I couldn't see and was coughing. I finally got the car aired out. I survived, the car survived and the Sixer survived.

The charger stand has nothing in it at all, so connecting the charger
results in 5V directly across a battery that is going to reach 4.2V
maximum at full charge.

Anyone else doing this should realise that the stand is essentially
useless, only charge the battery when it is installed in the radio.

Against the threat of negative feedback I should think they would send you a replacement anyway.

I bought a 2900mAh LiIon external backup battery for 5V USB devices. The vendor sent a charger clearly intended for small MP3 players rated at 300mA output. It failed after 2 minutes. I then measured the charge current and found it needed nearly an amp. When I complained the vendor pleaded for me not to leave negative feedback and immediately sent a replacement. Unfortunately the replacement was exactly the same as the one that failed, despite my specifically stating that it needed to be at least 1 Amp rating, so he is probably going to get negative feedback anyway.

I dissagree. I still think the charger stand is dumb.

It has no regulation to charge the battery.

>(Cheap too :-))

Yes, a cheap way to destroy your battery ;-)))

But, is it needed?

I use tons of Li-Ion CELLS and BATTERIES (there is a difference). You can buy the cell alone, two terminals going directly to the electrodes. But you can buy a battery (although it does looks like a cell) with charger controller and limiter INSIDE it. Bottom line: Feed constant voltage, and the battery charges itself to the top and shut down. Most of the cell batteries today are this way, and most of the batteries you buy with some kind of plastic box around the cells, are also this way.

I still haven't got my UV-3R. But I'll do some tests with the battery when it arrives and post here

391. Field test of my UV-3R

Yahoo group: UV-3R (2011)
Date: 2011-06-10 19:52:17 UTC
From: andyn1ksn
Topic: 391 Message: 391

Earlier this week I did the low pass filter mod on my UV-3R. Yesterday I took the rig out on a bicycle trip to test it out. (I purchased the UV-3R to take along on bicycle trips because it is small and inexpensive and without the antenna attached it fits in a "cargo pocket" of my shorts.) I used a Smiley Model 270 tri-band antenna, which is telescopic and quite compact when fully retracted.

The rig worked just fine, and I got good audio reports from contacts on three different repeaters, one VHF, two UHF. I had only two issues. There was wind noise on the mic, as I was out in the countryside with 20 MPH winds. I solved that by facing upwind. Second, I kept forgetting to adjust the antenna's length for the two different bands. It still worked.

Also, a previous evening I had a long conversation on two meter simplex with a ham neighbor who lives only a two blocks away. This is the best test I have for audio becasue he is fairly picky on such matters, and there was no repeater between us. He also said the audio sounded just fine.

So I am quite pleased with how the UV-3R is working. Although I am not a fan of the Nagoya brand (some of their models are dogs), I've ordered an NA-701 based on recommendations from this group. I'll run a return loss study on that model when I get mine in a couple of weeks and see how it does on the air.

Cheers,
Andy N1KSN

I have the stand and an extra battery. I did a bit of research and the battery and it is also used in a number of different products such as cell phones. It appears to have some protection in the battery to prevent overcharging as is common with these batteries (or single cell in this case).
I put my partially discharged battery on the charger and the charge current was 1.1 amp. The voltage across the terminals was 4.25 volts. I checked the current occasionally and it remained close to 1 amp until the voltage rose to almost 4.3 volts at which point it dropped to zero.
As there are only two terminals on the battery, there is no way of controlling an external charger so there has to be some electronics in the battery for safety and this quick test shows that.
I used the supplied wall supply for this quick check. The voltage on no load was 5.09 volts.
The radio sits nicely in the stand as well unless you have installed the belt clip.

Re: The charger stand

Well done Grant for doing the test.

I'm surprised the battery [1] has the required electronics
in it to regulate the charge, as I'm sure others are too ;-)

In which case I stand corrected.(And Kees Pa7two was right).

I think many of us have been quite content with our UV3R's as is
with no extra packs and have not got to the stage of examining these
things yet.

However, for me..well I have no use for a second pack to charge
so a charger stand is useless to me, besides if I need more
operating time then I'll prefer to use an empty battery case
and put my own cells in.

73 de Andy

[1]Yes I know a Li-Ion cell produces a nominal 3.7v, so indeed
our battery pack is a cell, however for the purposes of this
discussion, and many other elsewhere the terms cells and battery
pack are interchangeable.

I wonder why a charge circuit (with the LTC-4054-L IC) is present in the UV-3R when it is already build inside the battery.
I can ony imagine an additional protection when a non-standard power supply is used to charge the battery when it is in the UV-3R.
Anyway, it is nice to have a spare battery available that can be charged outside the UV-3R.
I was about to build the same charge circuit in the cradle, but that makes no sense when it is already inside the battery.

Because charging the battery blindly and hoping for the battery protection
circuit embeeded in it to cut the current is a recipe for making fire,
that's why :D

DO NOT charge a litium battery without a charge controller, the li-ion and
li-poly batteries have to be charged following a charge curve, for example,
the last 5% to top the battery you have to provide 1/10th of the initial
charge current and so on. Charging the li-ion/poly at constant charge is a
risk of fire and degrades the cell very quiclky.

for me, i like the spare Li- Ion battery compared to the external AA battery case.

1. the Li-Ion battery is slim, the AA battery quite thick

2. the Li-Ion battery is relatively affordable, $10 compared to buying original AA case plus original 3 units of high quality AA rechargeable or alkaline AA.

3. the Li-Ion battery is light in weight & easy to charge.

but then again, different people have different taste. as long as we can QSO, by any means necessary.

In 5 years time will the Li-Ion cell still be available ?

Can a Li-Ion provide 2900mah ?

I always like to have the empty cell case for all my handhelds
as an insurance ;-)

But as you say, so long as we have the means to talk.

In 5 years time won't you have bought some new radio that is even cheaper, even smaller and has other features like perhaps a built in MP3 player? Nobody worries if their mobile phone is still usable after 5 years.

In 5 weeks time I'll probably ave bought a new radio (compulsive collector). However, I tend to keep mine, even when it's been updated,so longetivity of any piece of radio equipment is always formeost in my mind when i purchase it.

>Nobody worries if their mobile phone is still usable after 5 years.

I do, especially when I purchase £500-1000 specials ;-)

Ok..so I'm awkward ;-)

Hello,

I had a VX-1, I have a VX-2 and VX-3, I just bought a few days since UV-3R for the colossal sum of 38 € including shipping from Radioshop888.
First findings:
It resembles the VX-3 in this shape and size, convenient to use, not commands in the menu, no skip, my model has two VHF and UHF antennas, difficult at first to have the reflex to change antenna along the strip.
Good sensitivity but is susceptible to noise band near the computer or another and certainly lacks selectivity.
The UV-3R is reserved for use in portable, nearly one corresponding to a repeater or at an event, exhibition.
It can not compete with its cousin the VX-3, but is still almost 4 times cheaper, even cheaper than a VX-1 VX-2 VX-3 or second hand.
So my opinion is that the price for our friends we sell BY is a good value for money.

73 Gilles F6EPE AVIGNON

(Traduction Google Hi…)

Bonjour ,

J’ai eu un VX-1 , j’ai un VX-2 et un VX-3 , je viens d’acheter depuis quelques jours un UV-3R pour la colossale somme de 38€ port compris chez Radioshop888.

Premières constatations :

Il ressemble étrangement au VX-3 dans ça forme et dimensions , pratique d’utilisation , peu de commandes dans le menu , pas de skip , mon modèle a 2 antennes VHF et UHF , difficile au premier abord d’avoir le reflex de changer d’antenne suivant la bande .

Bonne sensibilité mais il est sensible aux bruits de bande près du ordinateur ou autre et manque certainement de sélectivité .

Le UV-3R est réservé à une utilisation de portable , près d’un correspondant , d’un répéteur ou lors d’une manifestation , exposition .

Il ne peut rivaliser avec son cousin le VX-3 , mais est tout de même près de 4 fois moins cher , même moins cher qu’un VX-1, VX-2 ou VX-3 d’occasion .

Alors mon avis est que , pour le prix que nos amis BY nous le vendent il est d’un bon rapport qualité/prix .

The UV-3R has -ve ground.

The "outside" of the charge plug is +ve but it is not connected to the "ground" of the radio.

There is a DC short from the DC (-ve) ground and the antenna connector "outer" and the chassis.

So, I'd not expect a problem.

Care would be needed to ensure that the "outer" of the supply connector from the vehicle didn't come into contact with the vehicle chassis while not plugged into the radio but that is a different matter. (A simple "auto-reset-able" breaker would do the trick.)

414. Menu Options and Where to Buy?

Yahoo group: UV-3R (2011)
Date: 2011-06-13 16:04:55 UTC
From: Howie
Topic: 414 Message: 414

Hello to all and thanks for reading.

I keep hearing about the different menu options on the UV-3R.

What are the disadvantages of the 12 Menu model over the 18 Menu model? Could someone direct me to a URL where I can read about the differences?

Also, how can you be sure to get an 18 Menu model? My queries have gone unanswered from some Ebay sellers. It wouldn't surprise me if there was just one "seller" with many different names.

In other words, where is the best place to buy one of these little radios?

Thanks for any info, and apologies if this has been asked before.

It should be quite easy to reproduce the charge circuit and put it into the cradle.
A few additional components are required when using the LTC-4054L that is used in the UV-3R.
You can add a LED for the charge status (just connect it between the appropiate pin of the IC and the supply voltage with a small resistor).
However, the availability of the LTC-4054L IC is a problem, at least in Europe!
You have to pay a large amount, mainly due to the high shipping costs.
The IC itself is about 4 to 5 Euros, which is not too expensive.

Maybe someone has access to a better (cheaper) resource for this IC. It is manufactured by the company Linear Technology.
In the Netherlands Farnell is mentioned as an official distributor for these components, but the shipping costs are much too high!

Can anyone help??

73's, Tom PA2TSL

P.S: the pin layout of this IC in the circuit diagram (available in the Files section of this group) is WRONG! The data sheet is (of course) correct.

Would it work? - maybe
Will it be safe? NO, you will stress your cell and mostly certainly overheat them, shortening their life and risking a fire

I would recommend something like this:
http://www.sparkfun.com/products/8293
http://www.sparkfun.com/products/10401

2011/6/14 Lee <mr.olson@charter.net>

Topic: 175 Message: 424

Looks promising, the price is definitely OK!
However, it is meant for a charge current of >3 A, which is probably too high for the battery as well as for the 5 V adapter.
It is usable only when you can limit the charge current to approx. 100 mA.
Unfortunately I cannot read the IC brand/type that is used.
I may order a few of them and investigate how |I can limit the charge current.

Anyway, thanks for your feedback!

73's, Tom PA2TSL

425. mega409shop-estimated ship date

Yahoo group: UV-3R (2011)
Date: 2011-06-14 15:45:53 UTC
From: BobbyM
Topic: 425 Message: 425

I've been looking around at the different radio sellers on ebay and had a question about mega409shop's shipping. On Ebay the estimated delivery date to my address(Alabama) shows to be between "Thu. Jul. 21 and Wed. Aug. 3". I understand this is coming directly from China, but good grief-it shouldn't take over a month to get here! So my question is for anyone that has bought anything from mega409shop-how long did it take to get to you? Surely those arrival dates are off somehow-I can't imagine shipping taking that long!

426. Re: mega409shop-estimated ship date

Yahoo group: UV-3R (2011)

Bought 2 of them at mega409.

First took abt. 3 weeks, second only 7 days...

Strange strange...

It can take long. Think about: Hong Kong is an island. There is only one airport which is limited in air traffic. There is no other way: All the goods have to leave HK from there. BTW: I order a battery and programming cable from radio888. It was shipped out on June 8 and arrived just today. Thats not bad at all. Sometimes it tooks longer if i order something here in Germany.

Very strange. There are a few sellers whose estimated delivery dates show that it will only take 1 or 2 weeks tops to get here, whereas 409's shows a more than a month. Strange.

Oh yeah, I understand entirely why the shipping can take so long from Hong Kong. I just don't understand why Radioshop888's items only take 1-2 weeks to arrive, and mega409shop's take well over a month according to the listing on Ebay-when both of them are located in Hong Kong.

My order and delivery dates from RadioShop888 to Knoxville, TN:

UV-3R
Ordered May 6
Shipped May 6
Delivered May 19

FBA-37 (AA Battery Case)
Ordered May 11
Shipped May 11
Delivered May 18

USB Programming Cable
Ordered May 14 (Sat)
Shipped May 16
Delivered May 24

I ordered the radio from 409 and a clone AA holder from 888.

Both took 14 days to be delivered, this was over the Memorial Day holiday.

PS, my wall charger was bad (0VDC) so 409 say they are shipping a replacement.

433. UV-3R update from N1KSN

Yahoo group: UV-3R (2011)
Date: 2011-06-14 21:54:32 UTC
From: andyn1ksn
Topic: 433 Message: 433

I've taken my UV-3R out for a second bicycle trip. The rig did quite well again with my Smiley Model 270 antenna, hitting several area repeaters. I was at a high location and could also pick up signals on all seven NOAA weather frequencies (162.400 to 162.550 MHz), even though I'm sure the low pass filter modificaton cut down the signal strength there somewhat. All my favorite FM BCB stations also came in well.

I brought my UV-3R to a ham club meeting and two people who spoke with me over the radio the previous week were amazed at how good the transmit audio was from such a small rig.

The lithium battery charger chip used by the UV-3R, the LTC4054L, is available in the US from Newark Electronics. (I could not find it at Mouser or Digikey.) I ordered one for $3.10 this morning. I plan on trying to install it with an LED charge indicator in the charger stand supplied with the UV-3R using a 2.7K programming resistor. If I'm successful I'll report back.

Cheers,
Andy N1KSN

One other thing. This last weekend I worked on my non-Yaesu VX-3R AA case for use with the UV-3R. I used a Dremel engraving tool to cut three notches in the inside top of the case. The three notches line up with the small projections used to keep the belt clip from rotating. I also used a chisel to remove the center rib in the same area. Without the notches it is difficult to slide the AA case in place.

It is possible to cut the notches just deep enough to clear the three projections and not be visible on the outside of the case. But it is a somewhat delicate operation. I also removed a slight amount of material across the upper edge of the case. The case now fits pretty well and the slide lock at the bottom of the radio can be used to hold it in place.

I also used some rubber-type cement to re-fasten the three sickers which show the battery polarities.

As others have reported, the non-Yaesu AA case can hold non-rechargeable AA cells, but the NiCd and NiMH rechargeables I tried are just large enough that three of them can't fit in. As I plan on use the AA case only as an emergency backup, this is not a problem for me.

73,
N1KSN

I guess this is a simple question. 1 to 2 weeks, they ship by air. 4 weeks or more, they have no stock and/or they ship by sea.

Hello Andy,

Is it possible to buy approx. 10 e.a. for me, and send it to The Netherlands??
Thie IC is very difficult to get in Europe, and it requires approx. 35 Dlrs. only for shipping and handling!
I do have PayPal, so that would make it easy for the payment.

Hi Tom,

Yesterday I have seen such an offer on eBay.
10 chips of the charge controller for 12.90 Euro (incl. postage)

The "MCP73831 Lithium Accu LiPo Charger" is 100% the same as the LTC4054.

This is probably the easiest way!

Hi,

Another approach to charging is to buy an NP-60 battery charger from eBay - a search for 'NP-60 charger' will give you quite a surprise at the prices charged for some of the products, and you can also have a spare battery included from some suppliers.

This could be cheaper than reworking the existing holder!

Hi Nick,

Your prices are better! A good find. RS Components (UK) also stock the MCP73831 as RS 669-6137. Priced at £0.47 each (Eur 0.53/USD 0.77) plus postage. But only sell in packs of 10.

Group,

Following the information here with regard to NP 60 batteries, I have found variation in size. In one case a vendor reports one dimension as four inches. In general, dimensions sufficiently as to create doubt as to whether these really fit.What vendor(s) are people buying from that actually fit? My thanks in advance for your consideration of my question and your time.

Not usable for UV-3R are those CASIO type NP-60 measuring about 30x30mm. Instead you should look for FUJI compatible NP-60 measuring about 50x30x7mm.

As yet I have not had time to study the circuit diagrams for the UV3R yet. Lack of time.

I am just wondering if the tx filter that some of us have been modifying is the same filter that is used on rx ?

If so then I'd expect and variation in output power to have a corresponding relationship with rx sensitivity changing.

Does rx and tx share the same filtering ?

453. Keeping LiIon cells happy (Was: The charger stand)

Yahoo group: UV-3R (2011)
Date: 2011-06-15 17:26:56 UTC
From: cctbcn
Topic: 175 Message: 453

In many ways, charging a lithium cell is done in the same way that one charges a lead-acid cell: At a constant voltage.

Even for battery packs that do have a built-in protection circuit (and not all single-cell "batteries" do, it turns out!) it is NOT a good idea to "blindly" charge it and depend on the circuit in the cell to protect it - and you! Those circuits - when present - are there to provide protection against short-circuit conditions and, under the best of conditions, prevent gross over-discharge and over-charge situations.

On some single-cell "batteries" the full suite of protection is simply missing as it is expected to be supplied by the device. When a single cell is involved, you can actually get away with this because there aren't multiple cells in series that need to be individually monitored! In those cases, all that's really necessary is short-circuit protection (which can be as simple as a fuse) and, often, a means of monitoring cell temperature.

(I've not broken apart the cell for the UV-3R to see what's inside, but the report of a very hot, bloated cell makes me think that if there is a protection circuit that is present, it doesn't work very well!)

I've noticed that often, the protection circuit will "trip off" at a higher (or lower, as in the case of discharge) voltage than the device in which it is used. My guess is that it's up to the device itself to "properly" regulate the charge and discharge and leave the "extreme abuse" conditions (e.g. malfunction, accidental short, etc.) to the battery's circuitry.

But, to simply dump 5 volts from the wall-wart into the cell is unforgivable! If this had been the case with a cell phone manufacturer, it would probably have made the news and there'd have been a recall!

* * *

In the simplest case, to charge the cell used for the UV-3R, you simply need apply a constant voltage to it - in this case, up to 4.2 volts.

The charge controller chip actually does a bit more than this:

- If the cell voltage is really low (say, below 2.7 volts - but it varies depending on the cell's chemistry) then it will apply a "trickle" charge for a while until the cell's voltage comes up, at which point it will switch to full-rate charging. This tactic minimizes possible damage owing to the fact that at low voltages, LiIon cells become even more "fragile". If they are allowed to EVER drop below 1 volt or so, irreversible changes in chemistry occur and they probably cannot EVER be safely charged again! Many chargers - if they see such a condition - will refuse to even start a charge cycle at all!

- The cell should NEVER be allowed to see more than 4.2 volts (although this changes with chemistry - some cells "max out" at 4.1 volts or lower.) Doing so exponentially accelerates decomposition. One time - just to see what would happen - I applied 5.0 volts across a

18650 LiIon cell and after about 2 hours, it blew its safety plug, venting strong-smelling electrolyte and making a mess. (The test was done in a "safe" area where it could have exploded without causing collateral damage.) The cell used in the UV-3R pack is a "prismatic" rather than cylindrical type, so it would probably just "bloat", get hot and melt surrounding plastic rather than loudly pop as did the cell that I abused.

- LiIon chargers have built-in current limiting to prevent too-heavy a charge. In the case of the charge chip in the UV-3R, this charge current is probably quite low owing to the fact that the chip is quite small and the limitation is probably mostly a thermal one.

- Upon reaching the target voltage, the charge current will start to drop. At this time LiIon chargers will usually start a timer and after some time (usually 12-ish hours at most) they will terminate the charge cycle altogether - although the LTC4054 used in the UV-3 will stop the charge when it gets to 10% of its "programmed" charge rate in lieu of a timer. The reason for this is, as mentioned above, that LiIon cells degrade VERY rapidly at higher voltage and it's best not to keep it there for any longer than necessary. In fact, topping off the charge at 4.2 volts in stead of 4.1 volts will dramatically reduce the lifetime of the cell (by half, some people say...) I've read that for critical applications LiIon cells are charged to much lower voltages (3.7-3.8 volts) and the tradeoff of lower capacity (e.g. not as fully-charged) versus longer lifetime is taken. To be sure, after just a year or two after manufacture, any LiIon cell that is kept fully charged to 4.2 volts has likely lost at least 25% of its capacity so giving it that extra few 10ths of a volt for more charge capacity only works when the cell is brand new!

- Keeping a LiIon cell on a trickle charge at the "full" voltage is a bad idea as that greatly reduces its lifetime. If you want to put away a LiIon cell for a long time, it should be run down about halfway and stuck in a cold place: If it's put in a freezer, it should be tightly wrapped to prevent formation of ice crystals and it should be allowed to come up to room temperature before charging.

- Finally, it's worth remembering that LiIon cells typically last 3-5 years before losing whatever percentage the manufacturer says the can lose before calling them "bad." (They may still work but the capacity may be low.) This lifetime clock starts when the cell is made and is greatly sped up when the cell is at full voltage (e.g. 4.2 volts) and/or is hot, but is slowed when the cell is kept at a lower voltage and/or is kept cool. In other words, a 5 year-old LiIon pack at a bargain price is probably not a bargain!

* * *

So, for making a charger for the UV-3R packs, all you need to do is give it a current-limited, 4.1-4.2 volts from an LM317 circuit - although that wouldn't work with just 5 volts from the UV-3R's wall-wart which puts out only 5-ish volts: You'd need to use a low-dropout regulator for that such as the LM2930 or LM330 - and remember to not leave it on the charger forever.

Years ago I constructed pair of 3 amp-hour LiIon packs for my old Yaesu FT-530 and its charger is simply an LM317 set for 4.1 volts to slow the inevitable degradation. To charge the pack, I simply slip it into the charger and let it sit overnight, taking it oout in the morning. Since I'm on my 2nd pair of LiIon packs after 8 years (I've "rebuilt" it once) I can't be treating them too badly! Of course, there's a slight risk in such a simple charger in that it can't detect the condition where a LiIon cell is at too-low a voltage to be safely recharged - but in the case of the FT-530, the radio will simply shut off before that voltage is reached - plus there's also the built-in protection circuitry in the pack

that prevents such a condition so that situation is unlikely.

73,

Clint
KA7OEI

P.S. I have to add this: If you choose to build your own LiIon charger or mess with LiIon or similar cells/batteries, you do so entirely at your own risk!

454. Speaker-mic

Yahoo group: UV-3R (2011)
Date: 2011-06-15 17:35:32 UTC
From: Terry Taylor
Topic: 454 Message: 454

Has anyone found a speaker-mic that is wired properly to work with these radios, or do I need to rewire one of my Yaesu ones?

I have a one wire and a 2 wire earpiece/mic left over from a Yaesu VX-2R and both of them work fine with the UV-3R

I just tried the 2 Yaseu-compatible speaker-mics that I
have, both had VERY low receive audio and not transmit
audio. More research is necessary.

The no-name speaker-mic I got at a swap meet for my Yaesu VX-5R works, however it is weak on receive. You need to use an earphone with it as they attenuate the earphone audio so much that speakers will not work. That is OK with me, as I find you really need an earphone when you are outdoors in any kind of background noise.

Thanks,
I hope I got it all correct.
Wasn't too sure on the Dual Watch, but it looks like it only works in VFO mode.
Other thing that is unclear is Menu item 17, others may know what this actually does?

Hi,

Happy to see there are more F in this group !
Just got my uv-3r from radioshop888 to ! Made some short over the local repeater in order to give it a test run. I got good audio reports, The other station thought i was in my car !

If i remember rightly, there was some writings about not being able to turn the volume all thge way down to zero, mine is able to do that. Moreover the first volume level is not to loud !

Great rig for the money ! I'm thinking of tons of application for it, low power epeaters, compact APRS applications and of course as an everyday radio to carry with me !

73
Geoffrey F4FXL

Bonjour,
Je suis content de voir qu'il y a d'autres F dans ce groupe !
J'ai recu mon UV-3r il y a peu de radioshop888 ! J'ai de suite fait un court QSO via le relais du coin. Les reports audio Ã©taient bons, certains de mes correspondants me croyaient en mobile !

Si je me souviens bien il y avait des messages disant qu'il Ã©tait impossible de mettre le volume a zero, le mien le fait. De plus, le premier niveau de volume n'est pas trop Ã©levÃ©.

Pour le prix, c'est un superbe appareil ! J'ai pleins d'idÃ©es d'applications, relais QRP, station APRS compacte et bien sure un TX Ã toujours avoir dans la poche !

i order my saterday, and i did get a postoffice tracking number monday , so it al hangs on customs busy flights ect , but they do ship in time.
i do sell and buy a lot on ebay , normaly from europa to usa takes 10 working days but it happend more than you want at least 4 weeks ,

here is way it takes so long to usa :

Mail delays caused by temporary measures imposed by USFollowing an incident involving improvised explosives in a plane to the USA, all packages to the U.S. are subject to stricter screening by U.S. authorities. This allows the delivery of items for customers in the U.S. delayed.. The delivery time will be a maximum of two weeks more than normal.

Tried to get the Camo (green) style version.

Without any luck. Direct access via the manufacturer leads you to PO FUNG. Lot of discussion and equivalent prices to 409shop.
Payment via Western Union while they also have paypall.
Now website not longer accessible via alibaba.com. Makes me curious.

So anybody who knows where to get the Camo style radio?

Thanks for helping out.

Brickolore,

Did some further checking on the email chains that occured following the reference to the Baofend company website.
baofeng@....

This message gets forwarded to PO FUNG and it's members.
Baofeng@... does not react on initial mail.

PO FUNG comes with invoice and sends it with asia.radio.sale@...
Strange isn't it.

Checking via Alibaba.com on the mail exchanges with PO FUNG (HK) ELECTRONICS etc it occurs that further correspondence is already blocked as the receiver is already removed.

Think this might be a scam.

Maybe i was just lucky.....

So no Camo style UV-3R. If they exist.

I believe you are correct.

Vero Telecom is the manufacturer. This is where I found the pictures with all the different colors. I have never actually seen them being sold.
http://www.verotelecom.com/Dual-Band-Two-Way-Radio-UV-3R.htm

Baofeng and Magiksun both brand the UV-3R as their own and resell them. There may be others.

From: w2eec
Topic: 477 Message: 477

Hi all.
When I first got my UV-3R, everyone had problems with the earpiece that came with it so I never gave it a try till now. It works with no problem at all. I don't know if it is different form what others got but it works very nicely. I got the UV-3R from radioshop888. This was a pleasant surprise for me. I tried it both on high and low power and it worked for both.
Second. This may not be a big thing for most but I finally figured out how dual watch worked. Nice feature. I wish somehow you could use dual watch with your memories that you programmed in and also I wish you could set a primary priority station. That would be nice but for the price, I am very pleased with what I got.
I use it everyday at work now.

Hm...
next strange thing:

after programming the memory with the UV-3R software i get random numbers in the display when the rig is on VHF like 144.3B6. When changing frequency with the knob the frequency jumps up and down. like 144.422 to 144.567 to 144.6_2.

That is really strange.... Did factory reset already....

Hi Alex,

thanks for the tip !! It works !!!
Now i only have to figure out how to open my 70cm repeater. I cant get it open although other repeaters on 2m can be opened....
I have also done the volume mod. Now the volume is very pleasant. In lack of a 62 kohm smd i used a 56 kohm.

I have just opened a nearby repeater on 2 m. When the repeater sends the cw id the reception is frequently interrupted by a fraction of a second. Anybody out there experienced the same ?

So lets see what i find more...

Topic: 486 Message: 486

Hello to the group.

I have purchased one of the above mentioned battery boxes, and can confirm that major surgery is required to make it fit, and also that rechargeable batteries will not fit inside the case.

Another potential problem has occurred to me. Whilst modifying the case, I noticed that the metal strips connecting the batteries are exposed. I fear that these strips could short out on the aluminum heat sink with disastrous consequences.

Has anyone used one of these boxes, and if so, was everything ok?

I think the problem of the fuzzy squelch has been mentioned here before. Will look into that...

Theres no trace what actually controls the squelch and I don't think that it is managed by the RDA1846 itself (at least it's not mentioned in the datasheet), but who could do it instead?

It is caused by lack of strong signal rejection from other nearby signals.

Typically on 70cm if you have any wireless devices, alarms or key fobs nearby the Baofeng does not like the signals from them whilst trying to listen to your local repeater for example and will shut the squelch whilst trying to deal with it.

If you put the radio on a signal generator you do not see this as there is no longer an aerial on the radio so it doesn't see the offending other signal.

This is the price you pay for a cheap wide band receiver.

From: dl6er_ham
Topic: 133 Message: 491

Addendum: There is a feature "SQ" mentioned in the datasheet, but it is controlled via the GPIO-Pin 6 and therefore only capable of the binary states "ON/OFF"...

So maybe really the MCU itself controls the SQ (afaik thats only possible using the Received signal strength indicator (RSSI)...

Anyone mentioned a significant drop in the indicator, just when the audio pauses? That would perfectly explain, why there isn't such a problem, when squelch is set to 0...

Yes, it means carrier operated or time operated squelch when scanning.

So, in CO mode it will stop on a frequency until the squelch closes, in
TO mode it will stop for a certain time and then continue scanning even
if the squelch remains open.

Are you using the NARROW bandwidth setting ?

This may be your problem.

It may explain why you cannot open some repeaters, because the
deviation of the toneburst may not be enough.

Just a thought.

Just tested mine on a signal generator (HP 8920A test set). Test frequency was 145.600MHz, test tone of 1KHz at 3KHz deviation and CTCSS of 100Hz. The minimum deviation required to open the mute was only 30Hz. At this deviation, the mute would open reliably at only -122dBm input signal. At 500Hz CTCSS deviation, it would reliably open at -123dBm. Having the 1KHz test tone on made no difference.
The delay to open is ok but the delay to close after removing the CTCSS is a bit long but still acceptable to me.

Grant, ZL2BK.

Hey Stuart.
I have tested the aftermarket and Yaesu VX-3R AA battery cases. There are some pic I took of my findings and some text I added below each pic in the photo section. Most rechargeable AA batteries won't fit as you found out. The rechargeable AA batteries that I have do fit in the Yaesu OEM VX-3R AA battery case. All the info I have is there.
As far as shorting out, I don't know. My AA aftermarket cases with regular alcaline AA batteries did work good for me with no problems and the Yaesu AA battery cases looked the same and I had no problem with them either. Best of luck.

I've just finished adding a charge controller chip to the charger stand supplied with my UV-3R. I used a low-power version LTC4054L-4.2 and programmed it for 150 mA of charge current. I also added an LED to indicate (by shutting off) that charging is complete. To deal with the very small SOT23 package I used a DIP to SOT23 adapter board from Sparkfun (Part BOB-00717).

A few more details and a picture are in a pdf file in the FILES section.

Cheers,
Andy N1KSN

Sorry boyz,

But the radio discribed is only ONE band NOT dualband so beware before ordering !

Hi,

I don't think both are mono-band. At least the UV-5R/5H tells us, that it *might* be dual-band:

Look at http://www.century-comm.com/en/showpro.asp?class_id=70&id=1020

>Technical performance:
>- Menu Mode
>- Dual Band
>...

Although the mention of "Dual Band" seems to be the only difference between both radios. If you look on the picture, you might see the "U/V" Button that would be senseless on a mono-band radio (hihi).

I think that yesterday they also mention 1.25m band...It looks as if the page is still not finished and the spec.data changes from time to time.

yes ,

i think UV-5H is the Dual Band & the NC-5H is the Mono Band as described/writed on the technical performance for the Both Models.

Regards

510. Fujifilm NP-60

Yahoo group: UV-3R (2011)
Date: 2011-06-20 20:26:31 UTC
From: grantnz2000
Topic: 510 Message: 510

I found a Fuji NP-60 batteryin the drawer from a faulty Fuji camera that was disposed of about 4 years ago. It fits the UV-3R. Tried it and the radio turned on reporting 3.9 volts. Not bad for a bettery that has been sitting for all that time.
I have now had it charging in the radio overnight so will be interesting to see how it lasts.
It's rated at 1035mAh.

Grant, ZL2BK

511. Re: Baofeng UV-3R have problem on RX - cut RX

I guess, that is the correct explanation for this issue. Wide or narrow setting has no influence on this behaviour, since I noticed the "chopping" even when there was no modulation on the signal.

Most probable the squelch circuit mute the signal for short period.
I could not observe this problem anymore by using CTCSS on the RX.

On 6/4/2011 I ordered my UV-3R with programing cable from radioshop888 on ebay which was a Saturday. I got here today, Monday, 6/2/2011. Not bad. I had the software already installed and it uploaded flawlessly. The NP-60 battery I got from eBay for $0.99 including shipping fit perfectly and is charging in the radio. My antenna for satellite work is almost finished and based on Cheap Antennas for the AMSAT LEO's Kent Britain -- WA5VJB. My Dual-Band antenna is on the way along with an assortment of SMA connectors and jacks and some RG-174. The next antenna is going to use the Dual band antenna and one of the SMA jacks to make a small ground plane for my apartment. There is a 440 linked repeater system covering most of Wisconsin and one of the nodes is 4 miles from my apartment. I guess this little radio was a nice way to get back into Ham radio.

Lee,
Can you clarify the order and ship dates? It looks like a typo that it arrived 2 days before you ordered it. I ordered one from mega409shop and they shipped it on June 14 and it's not scheduled to arrive for a month.

hi there

its ok having a battery that fits and works, but i'd be worried about the voltage, as the radio voltage is only 4.1, so putting a battery that is less would be save, but your not getting the full power from the radio, and as for the mah, the higher that is, the longer it will last

hope this helps

lithium batteries have "standard" voltages, ranging from 3.6V discharged to
4.2V fully charged, so no worries :)

I would worry instead about protected/unprotected batteries (embeeded
under/over voltage, overcurrent and overheating protection circuit)

525. Accu packs

Yahoo group: UV-3R (2011)
Date: 2011-06-21 10:56:16 UTC
From: pd0rtl
Topic: 525 Message: 525

BAOFENG's original accu is named B30 ,1200mA
Replacements are Fuiji NP60 1400mA
and PDR-BT3 ,also 1400mA
The pack what i have in my toshiba P10 HD is 1700mA
but realy expensive xD

i also would sugest to get a proper pack loader, the pack loader for the pdr-bt3 is perfect.
i dont trust that elcheapo external loader from baofeng it self.HI.

Thank you Kurt for the feedback. In retrospect, I kind of wish I had put in the "high power" charging chip, but I am happy with the result. At least I don't have to worry about overheating inside the charger, and the battery seems to charge up fast enough for me.

I'm using a well protected linux-system, so I decided to look what the link offers, but it is a dead end - it says that the file has been removed or is out-dated.

So I think PD0RTL may was just right...

No No, don't delete me on this group.
I don't know what's happened.
I had send the link many weeks now via wetransfer.
But i don't know why it re-appear again now.

let me send a message to the File transfer "Wetransfer" owner.

Regards

535. UV-3R VHF range extension

Yahoo group: UV-3R (2011)
Date: 2011-06-21 19:19:27 UTC
From: carolinesouth66
Topic: 535 Message: 535

Hi Guys,

I am newbie to this rig, so forgive me if its been covered. I wonder if anyone has extended the VHF range, I would like to have the range extended to 176Mhz to cover some work related transmissions.

I guess if this has/can be done it would extend both its bands.

On a different subject, whats with all the 'offers' of file downloads?
Which i have been deleting, is the group being targeted?

Cheers..Reg G0BUY

Hi,

you can't expand it over the specified range (datasheet RDA1846).

The max. possible range of the DSP (which is the actual T/RX):
from 400MHz to 500MHz
and
from 134MHz to 174MHz

So I'm afraid there is no chance to extend the VHF-range...
UHF-Range *might* be expendable in the future (if someone cracks the MCU-firmware), but that won't be easy to do without special equipment...

Hi Kurt,

I think your English will just work well, but your Chinese might be a little rusty (hihi). Surely the translation is bad at this point.

As far as it has been discused here, no one known about it and no one has experienced any difference with it and without it...

Does anybody know how to get the (original ?) Chinese Version of the manual? Maybe we could translate it a little better...

at 150mA takes about 10h to charge a 1500mAh battery

Depends on the battery, I would not go higher than 500mA (~3h)

549. Re: [UV-3R] UV-3R VHF range extension

Yahoo group: UV-3R (2011)
Date: 2011-06-21 21:48:08 UTC
From: Reg
Topic: 535 Message: 549

Hi Guys,

Sure I can buy another Harold, but with the rig so close (I can already use some of the freqs for my job from 173Mhz) I naturally figured the appropriate chip inside the rig 'might' have enables an extension. But I guess I should have realised they would have enabled it.

I needed to test on both receive and transmit equipment that is used in educational establishments, and this rig is very convenient. At present I use a Yaesu HH scanner for TX checking in this range. but hey this rig already covers the bottom edge so I'm cool using it for that.

BTW It arrived from HK in less than a week.

Cheers

Reg G0BUY

I have used a MAXIM IC (MAX 1811) for the stand modification.
It has the same functionality as the LTC4054L. However, you can only set a fixed charge current (by connecting a pin of the IC to gnd or +5V): 100 mA or 500 mA.
I have chosen for the 500 mA charge current, which results in a full charge cycle of a few hours (did not measure it in detail).
The battery does not heat up at all. Btw, it did not heat up without the charge circuit prior to the modification (straight connection to the battery) so I assume that the charge current of 500 mA with the IC is not too high.

The original IC (LTC4054L) is difficult to purchase in Europe (high S&H costs, to my knowledge) and that's why I have chosen for this alternative which is much better available (and cheaper).

2 stands have been modified, with succes!

For charging time, take the amp-hours of the battery and divide by the charging current. For example, a 1000 mAh battery that was fully discharged would take 1000/150 = 6.7 hours to charge at the 150 mA rate. That, at least, is a workable estimate.

Were I to build the higher current version, I'd set it for 450 mA charging current. From what I understand about lithium batteries, they can take pretty high charging currents. I think the limitation would be more the heating up of the charging chip inside the stand. The datasheet has much to say on this. For an SOT23 surface mount package, the heatsink is usually the ground plane to which the chip is connected. My "design" tries to use the header pins as a substitute.

Hope that helps. Thanks for your interst, Lee.

The "high power" version is LTC4054. The full model name is LTC4054ES5-4.2. I just checked the Newark website and this version is a "non-stock" item. The low power version I used is in stock.

Even though the price of the MAX1811 is higher, it must have better availability if you can find it on eBay, and Tom has used it successfully. For one-shot projects I don't mind paying a little more, as the shipping costs can be higher than the component cost!

Cheers,
Andy N1KSN

The NP60 replacements I bought for $5 on eBay came with a wall charger,
which accepts 12v or 120v.
Maybe the innards of that could be transplanted. It has a charge-ready
detect in it and an LED.

Lee, I found a VERY inexpensive battery charger chip that is similar to the Linear Technologies unit. The chip is made by Microchip and is model number MCP73812. You can find this at www.mouser.com for $0.60. It has a programmable charge current and is in an SOT23-5 package. The Mouser site has a link to its datasheet.

There is another model, the MCP73811 which has a fixed 450 mA charge current and does not require a programming resistor. It costs $0.56.

One difference from the Linear Technologies chip is that there doesn't seem to be a pin that can be used with an LED to show when the charge is complete. This may or may not matter to you.

Cheers,
Andy N1KSN

Hi,

Why not connect a common anode dual red/green 3mm led, anode to
IC supply input and green cathode via res to ground and red
cathode to Ic o/p.

When battery is charged you only get green led on.
Assuming you can buy these singly and not in 10's or more?

I have added some photos of my modified cradle using the MAX1811 IC.
I have chosen for a charge current of 500 mA which results in a few hours charge cycle!
2 leds are used: one for the +5 V and one for the charge indication.
In addition, I will add the datasheet of the MAX1811.

From: Lee - N9LO
Topic: 567 Message: 567

I see there are 2 versions of the capacitor mod for harmonics. One is 47pf and the other is 33pf. Which is best? I was removing an external antenna that I over tightened and the SMA connector came loose. I then found out how easy this radio is to open up again to do the mod. I sure like Yahoo Groups and all the nice people.

33pf gives you another 0.5w on 2m and about another 10db harmonic suppression.

47pf gives you no extra power but another 20db harmonic suppression, and if I remember correctly lower power above about 160Mhz.

The choice is yours ;-)

I use 22pF. This gives over 40dB harmonic supression. 33pF is also fine, but 47pF is too much.

The discussion is in the Files section, in Mods. There are two main messages.

Anybody have the plans for a group buy of the SMT part? It might have different characteristics due to the reduced inductance.

572. HIDDEN MENU .....ADJUST POWER OUT.....

Yahoo group: UV-3R (2011)
Date: 2011-06-24 13:46:49 UTC
From: iz1pny
Topic: 572 Message: 572

Good day, for regulating the power out, someone knows as it is approached to HIDDEN MENU ?
All' thanks.

IZ1PNY.

574. Re: Capacitor Mod

Yahoo group: UV-3R (2011)
Date: 2011-06-24 14:48:55 UTC
From: andyn1ksn
Topic: 567 Message: 574

I installed the 47 pF cap. It gives more second harmonic suppression. There is less power out on VHF frequencies above the two meter band, but that should be irrelevant for a ham operator. UHF is unaffected by the mod.

Andy N1KSN

>
> I see there are 2 versions of the capacitor mod for harmonics. One is 47pf and the other is 33pf. Which is best? I was removing an external antenna that I over tightened and the SMA connector came loose. I then found out how easy this radio is to open up again to do the mod. I sure like Yahoo Groups and all the nice people.

575. UV-3R software with Win7

Yahoo group: UV-3R (2011)
Date: 2011-06-24 15:25:54 UTC
From: carolinesouth66
Topic: 575 Message: 575

Hi All,

I am trying to install the software with this rig, I installed the serial to USB file ok. And I did the same with the radio software but whilst I can get the radio prog up ok it does not appear to comm with the radio.

If I click on anything withing the rad prog it hangs.

Is there an issue with the S/W and Win7?

From: andyfoad@rocketmail.com
Topic: 575 Message: 578

Firstly, check you have selected the correct comport for the
software to use.

If you do that and it still doesn't work then you may have a cable
like mine, where the driver installs but it's useless with Win7.

Other cables may have a different level convertor and different
drivers that DO work with Win7.

In the end I had to use an XP machine to allow compatability
with the driver and the cable.

With the cable I purchased there is no known driver that is
correct for Win7, and you might have the same cable ?

Thanks Andy,
it was wrong com port, the radio software wanted com port 1 but
the serial driver software was set to port 15. Just a case of
altering so they all used port 1 and all is working fine.

Excuse me for my english....
I buy a new UV-3A and I misure the power output in the HAM band.
in 145 Mhz is 2 watt in Hi Power and only 30-40 mw in Low Power !!!
In 432 Mhz is 2 watt in Hi Poter and 800 mw in Low Power.
Is normal only 30-40 mw in low power in VHF ????
The low power is about 500 mw in 170 Mhz !!
Thank's

583. UV-3R Arrived from 409shop; contents and comments

Yahoo group: UV-3R (2011)
Date: 2011-06-24 18:14:50 UTC
From: Leigh L. Klotz, Jr. WA5ZNU
Topic: 583 Message: 583

My UV-3R from 409shop arrived yesterday and I picked it up at the post office today. Here are some comments about mine, so others can compare, as it appears the versions and box contents are evolving.

1. Supplied battery didn't fit so I used an NP60 clone I had on hand. I might have been able to crunch it in, but I don't want to crunch LiPoly batteries. So I think I need to write off the included battery.
2. 18 menus. No idea what RELAYM ("ELAYM" in manual) does.
3. Single antenna, short.
RX ok but didn't TX very well.
Another HT antenna worked FB for TX.
4. No charging stand, but included 110v wall wart.
5. When it starts up the vol is really loud,
but if you press Vol it goes back to what it was set to previously.
6. My LCD was scratched and I will try to get it buffed.
The upper right of the display is slightly pressure-colored.
I'll see if it gets better when I remove it from the case.
7. The biggest difference in use from the VX2/VX3 is the change in location of the power button.
8. It came with 20 pre-programmed frequencies: lost the first and ones:
?, 453.725, 454.325, 455.425, 456.525, 457.625, 458.625, 458.825, 461.925, 462.225, 463.325, 464.425, 465.525, 402.225, 436.425, 468.750, 152.275, 138.550, 157.650, ?

I was able to do most things without the nice cheat sheet in the Files, but knowing to press U/V to edit menu settings took me a few minutes to figure out. I had to change the step size to 5KHz also.

In order to program and recall memory, I had to consult the manual. The manual says you need to use "software" to program the repeater offset into memory, but I was able to program it manually (setting OFFSET and SHIFT with menus) and the programming it.

I plan to do the LPF capacitor mod and the volume mod. I have some 0805 chip capacitors on hand and will see if that fits. (0402 is really tiny.) I do have a spectrum analyzer and will check it after I put the capacitor in.

Hi,

Mine looked like a scratched screen, but in fact it did have a
fine plastic film. Check your on one corner.
Battery was tight fit but it was fine with a little help, mine
is only a week old so must be similar. However a second one came
today and it was slightly different in that it came with only
aerial as we in the UK like to call em.

Second unit came with USB lead, sure is easier to prog.

Reg,

Thank you for your encouragement. You are absolutely right about the LCD cover plastic, and I found a secret hidden compartment in the box containing the accessories (charge stand, USB connector, second (longer) antenna for 2M, and earphone. But no programming cable.

OK, I got the supplied battery to fit. The NP60 fits easily by placing battery in body of radio. This radio's supplied battery fits by putting bottom (non-contact end) in first, then pushing hard down into body of radio.

Yes and the dual band band antenna performs MUCH better than
the stock antennas.

Mine when switched to radio is interupted by ham channels or whatever it was on before the fm radio was switched on.
Pretty much think its normal, its a pity there is such a long delay before the fm radio comes back on.
I guess in time this may be hackable like most things?

Hi,

The 19cm antenna has no manufacturers name or type number, it is just shown as 'Antenna SMA Male 144/430MHz'.
The item ID code is: 5-003SM-UV and sells separately at $10.50 delivered.

The antenna is shown on the page at:-
http://www.409shop.com/409shop_product.php?id=105825

Hope that helps,

Ian

597. LPF mod with 33pF SMT 0805 part

Yahoo group: UV-3R (2011)
Date: 2011-06-25 03:55:42 UTC
From: Leigh L Klotz Jr WA5ZNU
Topic: 597 Message: 597

I did the LPF mod with a 33pF 0805 part, in the same location that Clint KA7OEI showed for the leaded ceramic disk capacitor. This part is too large to fit in the original location, but I would find that a challenge even if I had the right part.

I have posted photos and spectrum analyzer data from the mod at http://wa5znu.org/2011/06/uv3r-lpf/

Summary:

Near 144 MHz the 2nd harmonic was only about -22dBc at the antenna connector. However, I couldn't detect any spurious emissions above the noise floor when using the supplied VHF antenna.

After the mod, the suppression across the 2m band was 48dBc at about 144 MHz to 52dBc at about 148 MHz.

I will update the page with output power later.

Leigh/WA5ZNU

598. Power Plug

Yahoo group: UV-3R (2011)

599. UV-3R VHF and UHF Frequency accuracy 20-25ppb

Yahoo group: UV-3R (2011)
Date: 2011-06-25 05:01:58 UTC
From: Leigh L. Klotz, Jr WA5ZNU
Topic: 599 Message: 599

I measured the 144.015 and 446.000 MHz TX frequency against my GPSDO.
The VHF transmit was 3 Hz high (20 ppb). The UHF was 11Hz low (25 ppb).
I'm satisfied.

Hallo Ian and tnx for the reply.
How are the performances of 19cm vs stock antenna?
you noticed much performance gain or just a little increment?
Can you compare it with other 19cm antenna (like srh519 for example)?
Again mni tnx fer ur help

Yes, there is.

Right click on the link or the executable -> Properties -> compatibility

I have a W7 x64 Home premium, If you don't find the option maybe you have a lesser license or you are missing something

607. charger and cradle problem

Yahoo group: UV-3R (2011)
Date: 2011-06-25 18:58:30 UTC
From: jrf8964
Topic: 607 Message: 607

Has anyone had an issue like this? I hooked the charger directly to the radio and it worked. I took the same charger and hooked it up to the cradle and it stopped working. This happened to two chargers so I think it has something to do with the circuitry in the cradle. I've since ordered a battery charger and car adapter through a 3rd party and will give that a try.

610. Return loss (impedance match) of Nagoya NA-701 antenna

Yahoo group: UV-3R (2011)
Date: 2011-06-25 21:30:29 UTC
From: andyn1ksn
Topic: 610 Message: 610

I just got a Nagoya NA-701 antenna from Solid Radio in Hong Kong. Since this antenna has been recommended on this forum, I did a return loss study of it.

I've put a pdf file in the Files section showing screen shots of the return loss of the NA-701 for VHF and UHF. The file also has shots of the return loss of the Icom FA-S270C dualband antenna, which is the stock antenna for the IC-T70A dualband radio.

Return loss is a measure of impedance match. A return loss of 6 dB corresponds to an SWR of about 3:1. A return loss of 7.4 dB corresponds to an SWR of 2.5:1. A return loss of 10 dB corresponds to an SWR of about 1.9:1. (The less return loss, the better.)

The NA-701 has an excellent match on the two meter band. On the 70 cm band the match is just acceptable at about 6 dB (3:1 SWR). The IC-T70A stock antenna has a good match on two meters and a slightly better match than the NA-701 on 70 cm, namely 7 dB.

I just ordered the "no name" dualband antenna offered by 409Shop. When I get it I'll do a similar study. I have yet to find a dualband HT duck antenna that has what I would consider a good match on both two meters and 70cm, but I keep looking.

Best regards,
Andy N1KSN

I'm sure your measurements are correct, I got the same. But I would not call a 3:1 SWR "acceptable".

Maybe you want to try a Diamond SRH-519, this antenna showed very good results on both bands (2m better 1,4:1 and 70cm better 1,9:1).

big warning to everybody !

Never use the cradle for charging the battery !
Since this will kill the battery or the charger in a short time.

The battery has a maximum voltage of 4,2v and the cradle puts the full 5v from the power supply to the battery resulting in high currents and overloading.

617. RF output with external power output

Yahoo group: UV-3R (2011)
Date: 2011-06-25 23:57:19 UTC
From: JosÃ© Antonio
Topic: 617 Message: 617

Hi, I bought 2 UV-3Rs from 409shop last week and I'm waiting for them.

I've heard that this rig is a clone(or is quite similar) to the Yaesu VX-3R, so I took a look at it specs:

The VX-3R specification states that its power output is of 3W with an external 6V power supply.

My question is: what would happen if I use that power supply(6V) with the Baofeng rig? the electronic can be damaged? the power would be limited, or it would increase as in the Yaesu?

Has anyone tried this?

Thank you!

With a fully-charged 4.1V Li+ I get 2.8 W on 2M, but if I plug in the supplied charger, the voltage goes up to 4.5V and the power out goes down to 2.2W. I get 2.2W out at 3.8V as well.

On UHF,I get 2W out at 4.1V and 1.8W out with the charger and also at 3.8V.

This is with a 33pF SMT capacitor installed in the LPF output.

Is it really a clone of the VX-3R or is it thought to be a clone as it looks similar? I don't have a VX-3R but suspect that the internal design is rather different to the Baofeng.
As for the Yaesu 6v power supply, I suggest you check the polarity first. The UV-3R has positive on the DC connector sleeve with negative on the inside. I don't know about the Yaesu VX-3 but it's possibly the same as other Yaesu radios with negative on the sleeve and positive on the inner connection.
So apart from the higher voltage possibly being a problem, the opposite polarity would be damaging!

Heh, perhaps "barely acceptable," given how poor some ducks really are. Our HTs must be pretty tolerant of antenna mismatches.

If you look at the file I put in the Files section on SMA antenna return losses, you can see that my SRH519 didn't look nearly as good as yours. Maybe I got a lemon.

Thanks for your interest.

In the real world with any HT, I suspect the return loss on any antenna is often very poor just because of the way these radios are handled while in use. Just imagine what the return loss must be like with the antenna very close to your head or worse, on a belt clip with an external mic, and the antenna in contact with your side!
No excuse for bad design of the antenna though.

I don't have a VX-3R and my idea isn't to connect its power supply to the Baofeng.
I'm talking about increasing the supply voltage with a generic DC power supply.

Andy,

What are your test conditions?

I just used an SWR bridge to test the Yaesu dual-band antenna, which I have found via signal strength tests to be a good performer for its size. I get 2:1 on both 2m and 70cm if I tightly couple the radio to the case of the SWR bridge and hold the metal myself. I supect as designed, with the antenna directly on the HT and my hand on the HT, it is a little lower.

If I isolated everything and used the swr bridge case as the ground plane, it went to 3:1 as you found.

I have a VNA but it doesn't cover above 170 MHz.

That's true, SWR is not all, most handhelds can cope with bad SWR by reducing output power. There are many different aspects for those small antennas:
- the sharper the resonance curve, the less the losses are, that is the radiated power is higher
- only if there are multiple resonances a broad curve gives good radiation capabilities (but the design gets pretty tricky)
- that is, a reasonable SWR with a sharp resonance is best, but often a broad range is wanted

I measure those handheld antennas with a metal radio dummy box, which I put in my hand during measurement. It is important to decouple the attached line to the directional coupler /spectrum analyzer with tracking generator with a ferrite ballast. Also use only low power to avoid high stray RF.

I attach the antenna directly to the directional coupler. I also put ferrites on the coax going to the spectrum analyzer. I hold the directional coupler as if it were an HT, to try and take the body into effect. Power level is 0 dBm, one milliwatt. Of course, this is just an amateur setup, the best I could do.

Also as you say, impedance match is only a piece of the power chain, as radiation efficiency is also important for actual power radiated.

Although my "lab" results have corresponded with my and others' impressions of performance in the field, I would not "bet the farm" on the absolute numbers. I do think as relative measures they have some worth.

Only one or two of the antennas in my larger study were complete pieces of junk. All the rest worked at least fairly well. This is why when I first started this sort of measurement I was surprised at just how poorly tuned some of the antennas were, including some that are rather expensive.

Bernie, if you could tell us more about your methods and data it would be great. Kurt, controlled field tests would also be of much interest.

Dear Andi,

I put a photo of my setup in the photos section some weeks ago plus photos of my analyzer sweeps of the two bafeng antennas and the "original" Yaesu VX-3R duo-band antenna both for 2m and 70cms. Unfortunately my analyzer with tracking generator has only a CRT, so I have to make photos.
I measured already many handheld antennas, typically the YaeComWood have a reasonable SWR in the ham bands, while the Chinese varity is very different in terms of SWR, resonant frequency and bandwidth.
I've got here from Nagoya the NA-666, NA-771, NA-772 and NA-773, from SWC the SW-888 and a number of unnamed others.
The worst was that 1-1/2 inch dual band "dummy load" - a 50 Ohm resistor across the terminals and an inch of radiating wire would perform better in terms of SWR and radiated power..., at least according to my experience.
If interested, I can make some more sweeps of the Nagoyas the next week.

The UV-3R is not at all a clone of the Yaesu VX-3, even the dimensions are the same and the casing is similar.

Regards

Ah, now I remember your photos. Very interesting. I've also now measured four Nagoya antennas. I can't say I'm happy with that brand, although the NA-701 so far seems to be the best of them.

My pdf files include a Larsen shorty SMA antenna. It isn't too bad, but I only use it for hamfests and such.

I'd be interested in photos of your Nagoya antennas when you are in the mood to measure them. I don't think I'll be buying another one.

Cheers,
Andy N1KSN

Correct.
There is no electronic in it.
It is directly feeded from the suply, when you put the bat in it, it would load, and over cook it due no electronics.

yes, this will safe the battery if charged inside the radio.

For charging outside of the radio I purchased a battery charger
designed for photo/video or yaseu VX3 batteries. I got
one in ebay for 7,75 Eur including shipping.

Works fine and has automatic switch off and a charger status LED.

Hi There.

My Wallwart comes with a Led in the right bottom side.

I tryed to charge the battery in the cradle , and it works fine!!

At first the Led is Red , and after a few houres it turns in to
a yellow color , and a few houres later the led is green.

So there is a charge controller in the Wallwart with the Led build in.
And no there is no electronics in my cradle !!

I tryed the fresh charged battery in the radio , and the display shows
4.1V when i start up the Radio.

It is not a rapid charger , it takes about 10 houres for full charge.

But be ware , the small connector slips out very easyli from the cradle connector , so
firmly push it in !

I cannot say anything about the Wallwart whitout the Led.....

73 's Egbert PAØEJH.

Yes, google for NP60 charger and they're $5, with a battery. No sense
in using this one.
Or if you like the form factor, take the guts out of the $5 one and put
it in this one.

I have this problem, too. It takes several second for the transmitter to unkey. I suspected it was caused by RF, so I wrapped the cord fully around the HT and the problem goes away. I think this proves that it is RF. Perhaps now someone can come up with a permanent fix.

Dear Andy,
a bunch of antennas I put on the test bench today and uploaded the photos under 'more aerial measurements'

btw, for the 1-1/2 duck I had the chance to hook it up at a network analyzer, it showed a clear resonance at around 146 MHz, but the ohmic part was just above 1 (one!) Ohm. This gives an explanation, why the SWR was so lousy (unfortunately the analyzer does not cover 70cms).

From: tracyshaunroberts
Topic: 651 Message: 651

Hi All,
My UV-3R is ordered and on its way and it looks like one of the first things I will need to do is limit the volume. Unfortunately as I have an Australian Foundation license I am not permitted to modify the circuitry. I've seen suggestions as simple as putting some sound deadening between the speaker and the case. Has anyone experimented/had any luck with this.

Cheers.

Thank you very much Bernie! Well, I am even more convinced that I will never buy another Nagoya antenna. I wonder if they put the same (bogus) SWR specs on all their antenna advertisements, and just change the length and connector type.

I wish I had access to a good network analyzer. Your finding about the 1-1/2 inch stubby duck is very interesting. It is actually resonant in the middle of the 2m band, but is a poor match because the resistance at resonance is so far from 50 ohms. I think some may forget that resonance just means a resistive impedance at a particular frequency, not necessarily a 50 ohm impedance. One has to wonder if something similar is true of the other HT antennas that show a broad, poor match without a dip in the return loss.

My favorite HTs are two IC-02ATs, an IC-04AT, and an IC-03AT that I bought used on eBay a few years ago. I cleaned them up, replaced the memory backup batteries (which are soldered to the main PCB!), and rebuilt several battery packs. They only have 10 memories, but the front ends seem completely immune to intermod. Since they are monobanders, I could fit them with monoband Smiley ducks, which have very good matching. (For the 440 radio I also have a Larsen 1/2 wave which is very good, but VERY ugly.) Of course, they are the same size and weight as a construction brick, but I like that.

Is it surprising that such a short antenna has low resistance? This length equates to about 15 inches on 20 metres and about 60 inches on the 80 metre band. Any mobile HF operator knows that a very short antenna at resonance will have a very low radiation resistance. They take a lot of effort to ensure a good ground plane on the vehicle by bonding panels etc which usually drops the resistance even more! Then impedance matching is required to obtain a good match to 50 ohms.
Not much you can do about the ground plane on a small handheld and difficult to add any sort of matching.
Would be interesting to check any other manufacturer's very short stubby duck. I wouldn't be surprised to get similar results unless some form of loss is added to make the antenna look better.
These are my thoughts without any sort of actual data.
Grant, ZL2BK.

There are lots of good reasons for me to upgrade but I am very slack. It took me around 30 years to get around to getting a license to start with and I haven't been very active as my current home has no clear line of site to any of the local repeaters. The UV-3R is small enough that I should be able to just drop it in a pocket when we head out for the day.

Cheers,

Try here to start. I signed up and did the product inquiry so if you want to wait it out, I'll post their response. Says $60USD on the page so we'll see. If I can buy one direct, I will do so. I have a UV-3R on the way just today but this one is much more interesting.

That as my first thought when I saw the first videos of the original model on YouTube as well. Duh! Just plug the wall wart into the wall and the cradle, take the short cable from the second connection on the charger and plug it directly into the radio. Charging the radio with the short cable and a spare battery pack on the stand were likely what they were thinking, I have a cell charger for my older Samsung i-910 that does the exact same thing.

Just ordered mine today and they say it should be here in 5-10 days so I'll see if my stand has both connections.

Are any of these dual-band except the uv3h?
Anybody heard of anything interesting like the new Alinco 2m/220/900 MHz?

I realize the Chinse manufacturers aren't doing anything above 70cm yet, but they could have a real breathrough product if they could do an all-band VHF/UHF to 1.2 GHz radio...

But there is already a section, two actually to set the CTCSS for RX and TX. If it were DCS there would be a way to set it not just activate it. Maybe to set the 1750 tone? At first, with "relay" I was wondering about cross band repeat.

Maybe it toggles on and off all CTCSS functions altogether to hear the repeater without tone squelch?

Don't have mine just yet (it's on the way) but have been reading up on these things.

Oh, also, on some web site I read earlier today they said you should always upload a blank file to the radio before using the programming software (or was that from the radio...?) because this sets a corectly formatted blank master to start from. From a programming point of view, sort of makes sense as the data in the programs memory could be any weird bits from the factory I suppose. If you download from the radio to the software the application on your PC would be getting a correctly formatted empty file from the radio to fill in rather than random characters in the seemingly empty spots.

Or something like that.

I think that is sort of a dumb idea. If the thing goes into TX and you are injured, how long before the battery drains and it is useless? I would rather have it sit there waiting for me to hit the PTT, when I am again able to.

Also, if it is going into TX when it makes noise, is it possibly in VOX mode? That's how a lot of CW rigs work. The sidetone sets off the vox which causes the TX operation.

Hi Sean,

I've tried your suggestions, but as far I could bring up any relation to the setting of RELAYM ...

Some days ago I had the idea that it *might* be a feature to use with possible future radio-repeaters of Vero (e.g. Baofeng, ...)?

It remains an eternal mystery - perhaps they have merely added a menu item without any function? (hihi)

Careful there, NC-5H appears to be a single band radio.
I would not be quick to throw $60USD at something not even available over eBay.

Going to the manufacturer website, it appears UV-5R looks more promising. For now; however, looks like it's still vaporware to those outside China. Perhaps if they start getting CE and FCC certs for their newer models I might be interested.

Has anyone thought about possibly it is a function to clone one UV-3R to another one?? Trying to translate "RELAYM" in Chinglish could mean to transfer (relay) settings. Thought about it, but don't have a cable to try it yet. Lots of speculation about x-band repeat, It is my understanding this is a SINGLE VFO radio which would damage that theory wouldn't it?

I've bought my fair share of equipment from Hong Kong.
Some arrived in as little as 10 days, once I had a battery take 2 months. By that time, I had forgotten I even ordered it.
It looks like the holdup most of the time is at customs. They are just playing it safe with overseas shipments, and with a good reason.

On Ebay the estimated delivery date to my address(Alabama) shows to be between "Thu. Jul. 21 and Wed. Aug. 3". I understand this is coming directly from China, but good grief-it shouldn't take over a month to get here! So my question is for anyone that has bought anything from mega409shop-how long did it take to get to you? Surely those arrival dates are off somehow-I can't imagine shipping taking that long!

Hi,

I have had plenty of shipments for HK/China and Singapore, also from 409shop. Here the statistics of the last months to Germany:

Ordered shipped received dd/mm
13/04 15/04 04/05
21/04 23/04 03/05
21/04 22/04 29/04
21/04 01/05 06/05
23/04 25/04 12/05
24/04 20/05!! 03/06 !!
26/04 28/04 06/05
28/04 04/05 16/05
28/04 01/05 10/05
28/04 29/04 20/05
28/04 29/04 12/05
03/05 04/05 11/05
09/05 10/05 30/05
10/05 11/05 17/05
10/05 11/05 03/06
15/05 16/05 not yet as of 30/06
15/05 16/05 28/05
15/05 17/05 28/05
25/05 26/05 not yet as of 30/06
05/06 08/06 not yet as of 30/06
05/06 09/06 27/06
11/06 13/06 21/06
12/06 13/06 22/06
14/06 15/06 28/06

from 7 days to 2 months.
BTW: from ~100 shipments from Asia 1 lost, from USA from 10+ shipments also 1 lost the last 2-3 years.

From: Lee - N9LO
Topic: 673 Message: 673

I ordered a MAX1811 from Newark and got it for $3.48 but did not find out that I paid $8.16 shipping until they emailed the completed order to me. It got here today and I see why the high shipping cost. It came in a heavy padded envelope, anti-static bag, a 3" x 4" hinged anti-static plastic box which was lined with 2 pieces of anti-static foam. Wow. I was putting it into the charger without a board by attaching it to the glued in LEDs. I soldered the output wire on, the last solder joint, and afterward I must have wiggled the wire while putting the charger together and the output pin number 5 broke off the chip. Well, there is $12.48 down the toilet and I have leaned a valuable lesson. I now found the chips for $2.90 and a board for $0.50 and ordered 2 of each with $4.00 shipping for a total of $10.80. Here is where I found them.

Correct, the "NC" is 2m (plus/minus) but the "UV" is a dual band - Uhf, Vhf = UV. Did you look over the PDF spec sheet from KYD? That one is dual and has seemingly more features than the Baofeng. Still, nobody seems to have the UV model available to purchase yet anyway, plus as they are open ended outside the US bands, they will never get type acceptance to be legally sold here in the US. We will have to gray market them via Ebay etc., like we are with the UV-3R. As long as the spurs etc are correctly low, I don;t mind and I know better than to TX where I'm not supposed to. Still, having the FRS and Marine freqs, mighty tempting.

I just found this link from Andrews. It shows several Chinese models including the UV-3R (for $99 AUD?) and the new KYD UV model (also $99 AUD). Seems a bit high to us I think. We can buy 2 for those prices.

At least that's one site leading their name to the Chinese radios. It also says "coming soon" on the KYD.

I think the prices are higher in order to cover warranty service. Notice the KYD radios are not yet available, so it's still vaporware to us. I would be interested in alternatives to the UV-3R as the build and finish leaves a bit to be desired.

I noticed a Canadian dealer stocking the UV-3R. Price appears to be higher than eBay, presumably to cover their one year warranty service:

http://www.fleetwooddp.com/digital/index.php?main_page=product_info&cPath=31_33&products_id=512&zenid=6fc40906eff43cb78ea565bbf3b8ed06

Perhaps the KYDs will be out in time by year end?

HI GUY

Sorry , probably my question have no answer !!!

I have not understand IF the LPF mod increase the VHF POWER on LowPower setting !!!!!!
At 145MHz with lowpower set I have ONLY 40-50mW !!!!!!!

thank you so much

Be warned: the usb specifies a max of 100 mA per device, but you can
negotiate up to 500mA

Newer motherboards and laptops come protected aganist these uses (very
common, but out of the standard) but i would not recommend using it on older
or cheap computers.

Thanks for the info. I'll update the post with a warning.

Part of why I did this was to learn, so I will count that goal as successful.

I have seen, and the wiki page mentions, devices that use two USB connections to pull more current. Would that be a better solution?

not really. It does some variation on the output power but not too much. Low power is below 100mW in my uv3r too (with modification).
Anyway, the LPF mod is important to cut the first harmonic.

Yes, it's a nice feat, I only wanted to warn to avoid people smoking their motherboards .

About the double connection, I don't know, maybe it works better than a single connector.

It would be nice if the new group, like this one, is readable to all.
Having messages be member only makes the group invisible in Google searches.

693. Output Filter

Yahoo group: UV-3R (2011)
Date: 2011-07-04 11:05:29 UTC
From: Leon
Topic: 693 Message: 693

Hi there,

The output harmonics on 2m varies from -12db to -35db, this was measured over 6 units.

I stuck the filter design into RFsim99 and it came up with a solution that gives about 3 to 10db more suppression on the 2m second harmonic.

What I do is to remove C158 and fit a 33pF hi q cap to C89 position.
I currently only have 0603 caps so its a bit of a mission.I use digikey part number 490-4864-1-ND

On the next order I'll check if there is really bad ones, then I'll first try Leigh's mod, I have some 0805 33pF caps.

Regards
Leon

dirty dirty signal out of the UV-3R I can keyup other radios even if they are on different frequencies and even if the decoder is on.
I don't think these radio are FCC approved, they cannot be with these specs. Also, don't get too close to the TV or YOU WILL BLOW something out.

Hi There,

I really do not know what you are on about, the spectral purity of the radios I have tested is quite good, it was/is only the second harmonic that falls at +/- 290Mhz that is a problem. The deviation I measured is perfect. Keying up other radios probably means the other radios has un-tuned front ends.

With the second harmonic fix, I cannot see why these little radios would not make FCC part 90 approval.

Leon

698. DUAL BAND RH771

Yahoo group: UV-3R (2011)
Date: 2011-07-05 16:17:45 UTC
From: Lee - N9LO
Topic: 698 Message: 698

I purchased an antenna on ebay from China. It was called "DUAL BAND RH771 Long Antenna SMA-Male for Yaesu ICOM" and is 15" or 39cm long. In their ad he states, "please note, this antenna is not original diamond antennas, it is good quality replacement antenna." On the antenna it says, "DIAMOND RH 771". I finally got my SMA adapter for my Future Tech AW07A antenna analyser. I put the antenna on a magnetic mount on my truck. On the 70cm band the SWR was 1.4 at 420mhz with a low of 1.0 at 430mhz and an SWR of 2.6 at 450mhz. On 2 meters the SWR is 1.0 down at 138mhz, below band in the US, 2.3 at 144mhz and and 2.7 at 148mhz. Could these antennas be factory rejects that did not pass the final test?

Hell no !
These are REAL genuine fakes !ha ha !
But for the european market they will perform well enough cause we use 144 to 146 and 430 to 440 Mhz.

I've heard somewhere before that this is typical of chinese antennas you might find on ebay. I really wish I could remember where I read that so I could send you to the source. I'd really like to get my hands on an antenna analyser one day to check out some I have around here. I can bum a MFJ one but it only goes up to 2m, doesn't cover 440.

The resistor is in series with the speaker so indeed it's an extra load.
Photo's are as close -up as can be I'm afraid ;-)
I think it's obvious were to place the resistor !

The DSP is most of the radio. It isn't just used as a de-noiser like in some HF radios.

I believe it was done this way:
The spring was removed and soldered to one end of the resistor. The other end of the resistor was soldered to the pad the spring was on. A plastic insulator separates the spring from the pad but is nearly in the same position it was originally so as to contact the speaker terminal.

John,

It's not exactly misleading, but it's a different use of the term DSP
than you might be expecting from ham gear. Even though Ii says DSP on
the box, but that doesn't mean that the DSP is programmed for noise
reduction or other type of things you see in "DSP Speakers" or on some
of the mid-range HF rigs.

The UV-3R has two main ICs in it, one is the microcontroller than runs
the buttons and LCD and so on, and the other is the "DSP Chip" which is
a radio chip with digital-to-analog converters, and analog-to-digital
converters, and a host of other stuff that you can see here in the block
diagram of the chip. It's a "phasing" or SDR-type of device, but since
the main data flow is set inside the chip already (modulation, etc)
there's not a lot more that can be done with it than what it already does.

Here's the chip's block diagram:

http://detail.china.alibaba.com/buyer/offerdetail/view_large_pics.htm?offerId=868195531

For the radio itself, the UV-3R schematic and block diagram in the files
section of the UV-3R group shows how this chip is used in the UV-3R.
It's pretty much the whole radio.

There's a potential for re-programming the microcontroller in the UV-3R,
but it may an arduous task to figure it out, and in the end it probably
won't give many fundamental new capabilities. The main IC can't do 900
MHz, and there's not enough room to put in another set of output filters
for 222 Mhz, or 50 MHz, so there's not a whole lot you can do to hack
around with this radio as is.

SSB?
Packet Radio??
DStar??

don't think this would be a trivial task to implement.

Gerrit.

Maybe there is a possebillety for exended rx range ?
Or 150kHz wide FM on 70cm ?

Mark

The DSP is nice option.
it is only a shame that the "DSP" filtering kick so late in.
only if a voice realy is in bad noise it kicks in, and ehm, ye, the noise is gone.

I have a UV-3 that I would like to program from the computer. I have the correct cable (I think), but the manual does not say how to get it into "clone" mode, and then once in to "clone" mode, which button to push to send data or to receive data.

Does anyone have this information?

Thanks.

If you've alreay downloaded the program, it's pretty easy. Click on the device button and then click on read or write, of course you have to have the radio connected and on. I just programmed mine and didn't have any problem, worked like a charm, but I ordered a cable from Fleetwood Digital Products

then downloaded the program from 888radioshop. Godd luck.

I hope the following will be helpful.

Step 1:
DOWNLOAD the BF_3R Programming SOFTWARE onto your computer's hard drive.

Step 2:
INSTALL the BF_3R Programming Software onto your computer.

Step 3:
Connect the Programming CABLE to your computer and UV-3R.

Step 4:
Turn the UV-3R "ON"

Step 5:
Open the BF_3R SOFTWARE from the computer DESKTOP.

Step 6:
SELECT "Frequency Range" to display "V-UHF"
- Start loading the Frequencies/Repeaters into memory slots
- Save file with a file name

Step 7:
From MENU bar click on " DEVICE"
- Click on "WRITE"
- Watch the transfer of memory frequencies from computer to UV-3R.

Step 8:
Disconnect, etc.

Step 9:
PLAY with your RADIO. :-)

Group,

Douglas has provided excellent instructions! It doesn't get any simpler. This software is probably one of the best of Chinese origin. It permits printout of your programmed data, a feature I find very useful.

I have to say originally I too could not get it to work. Turned
out there is a com port to be configured.

If I recall there is a part of the program that decides on com
port. Also my Win7 had to have the win7 usb drivers installed
from the website.

COM PORTS!
- I knew I had forgotten something! ;-)

I am using Windows XP

With this OS...
Go to START
Select SETTINGS
Select CONTROL PANEL
Select SYSTEM
Select HARDWARE
Select DEVICE MANAGER
Scroll down to PORTS
Observe and write down on paper which PORT is being used on your machine.
Go to BF_3R progam
In MENU bar SELECT PORTS
Click the appropriate PORT
Click OKAY.

Subject: RE: [UV-3R] Programming the UV-3

After you plug in the interface cable check you Hardware manager to see what COM port number it is using and set the software to the same. What works best for me is to start with the radio un-plugged and off. Plug the cable into the computer, start the software, put in the frequencies and settings, plug in the radio, turn the radio on, send the data to the radio. If I do not do it in this order I get an sometimes I get an error. Also, after programming the software sets my volume to 0 so don't forget to turn it back up.

That is what I tried, but it is not working. I thought maybe there was more to it.

Thanks.

From: john_kb0ne
Topic: 707 Message: 731

After playing around with SDR receivers and looking at the block diagram for this little radio, all I have to say is, "How Cool is that?". Basically an SDR/T in a tiny box.

I think the UV-3R has outrageously nerdie modification possibilities.

But that's just me..... John KB0NE

PS I have 3 of them on a slow boat from China... can't wait to get ahold of them.

734. Re: Return loss (impedance match) of Nagoya NA-701 antenna

Yahoo group: UV-3R (2011)
Date: 2011-07-08 20:16:15 UTC
From: andyn1ksn
Topic: 610 Message: 734

I've added screenshots of the return loss of the "no name" dualband antenna offered by the 409 Shop, either on eBay bundled with the UV-3R, or separately on their website.

The antenna is similar to the Icom FA-S270C that is supplied stock with the Icom IC-T70A and to the Nagoya NA-701. A good match on two meters, a so-so match on 70cm. Useable, but not exciting, in my opinion.

Were I to spend most of my time on two meters I'd likely go with the NA-701 as its resonance dip is wider. However, if I spent much time on UHF, I'd consider the Icom or the 409Shop, as their matches are a bit bethere (but not by a lot). Given the experimental conditions, I would not spend any energy worrying about small differences in the measurements.

Cheers,
Andy N1KSN

>
> I just ordered the "no name" dualband antenna offered by 409Shop. When I get it I'll do a similar study. I have yet to find a dualband HT duck antenna that has what I would consider a good match on both two meters and 70cm, but I keep looking.

735. Re: Return loss (impedance match) of Nagoya NA-701 antenna

Yahoo group: UV-3R (2011)
Date: 2011-07-08 21:17:43 UTC
From: andyn1ksn
Topic: 610 Message: 735

I just noticed that the 409Shop no name antenna's base is just wide enough to hit the plastic flange around the LED on the top of the UV-3R. I recommend using a chisel or sharp hobby knife to remove a small amount of the flange so there is no interference.

Also, the no name antenna's radiator section seemed to be able to rotate in the base, which could ultimately lead to failure. I carefully added ACC super glue to the join to hold it.

Even with the concerns above, I still thing that at $10.50 US plus shipping the 409Shop dualband antenna is a pretty good deal.

Cheers,
Andy N1KSN

737. Setting RX/TX on different bands for Satellite work

Yahoo group: UV-3R (2011)
Date: 2011-07-08 21:29:58 UTC
From: josh_g
Topic: 737 Message: 737

Does anyone know if there is a way to set the UV-3R to TX on 70cm and RX on 2m (or vice versa) without using a data cable?

If not, can anyonve verify that it is possible with the cable. From the screen shot of the software it appears that you can set a TX freq and and RX freq, but are those limited to one band at a time?

Thanks for the help.

Josh

The ones just in have 18 menus, the volume goes all the way down to 0. The menus are:(from 1-18) RX CODE, TX CODE, SQL, LIGHT,BEEP,VOX, POWER, DW, STEP, OFFSET, SHIFT, STE, W/N, SAVE,TOT SCAN M, RELAY M, BCLO. The DSP works very well. The electret mic makes it sound like a mobile rig, got good audio reports on the repeater and RX audio is loud and clear. . The battery lasts almost 2 days of continous monitoring with a few radio checks days and repeater key ups. You need good eyesight to see the small icons on the display though. Other than that, its amazingly good for such a cheap price. I didnt drop test any cuz....."It aint no Motorola".

746. Fake diamond SRH805s

Yahoo group: UV-3R (2011)
Date: 2011-07-09 21:05:48 UTC
From: max amillion
Topic: 746 Message: 746

hello.
I am new to this group and new to the whole handheld transceivers scene.
I have recently purchased a dual band antenna without properly researching my options and reading the reviews. It is a fake diamond SRH805s (ducky) short antenna from ebay. I am reading nothing but bad reviews on this antenna. most people are reporting infinite SWR.
I mostly bought this antenna because it was cheap and it looked cool. Also, a person doing a review on youtube on the UV-3R had attached this antenna and claimed it was good.It also had some pretty good specs listed.
I am getting some serious buyers remorse.
does anyone have any experience with this antenna?
is there a way to fix or re-tune it when i get it?

i am seriously thinking of just buying a Nagoya NA-701 and calling it a day.

thoughts?

Putting an extra resistor in series with the speaker DECREASES the load. This should be made clear so people don't think the audio amp is working harder.

It is possible to set tx and rx on vhf/uhf or visa versa. See the frequency files on this site. I've uploaded, among other things, the low earth orbit (leo) stelitte frequencies adjusted for doppler. With the Elk handheld log periodic I have listened to these "birds" passing and while regularly workable with the Wouxun KG-UVD1p's 5 watts my little UV-3R's 1 3/4 watts hasn't made it yet. Still trying.

I think you missed what it's about...
I have not mentioned in or decrease load.
Do not make more of the item what it really is.
It's just putting extra resitance so the audio will be baffled a bit !

760. New to this Group - has anybody found a side-by-side review of UV-3R to Wouxun?

Yahoo group: UV-3R (2011)
Date: 2011-07-10 15:06:05 UTC
From: ve9xyz
Topic: 760 Message: 760

Reading on these ultra-small dual-band HTs is pretty interesting to me, and I've seen similar excitement about both the UV-3R & Wouxun - this makes me wonder if there's a fair side-by-side comparison of these 2 contenders yet?

Anybody that has both care to comment?

Thanks,

Kevin

I just bought a UV-3r radio, it came with the software and serial port cable. After installing the software and clicking on the Icon I get a error, Unsupported operation was attempted, then the program will open up. I can connect to the radio, but it will not show the dat file it download from the radio or will not show the list of channels programed.

Anyone have any help on this. I have tried the software from the Yahoo site, both of them, gives me the same error. I have the newer radio with 18 menu settings and DSP.

Hello all,

I am Chris NH7QH located in Aiea, Hi. I have joined group since looking for more info on UV-3R. I have a part time Radio Supplies business here in Hawaii hard to get stuff locally. Last year I started importing from over sea. I bought in allot samples different Part 90 approved radio so I went with WOUXUN and order 100 WOUXUN's about same everyone else did. Then I looked at better prices on accessories for WOUXUN's. So I brought in speaker mic, antennas, batteries, cases, and etc. Sell locally and on eBay sales grown so much last year. Looking for next thing well here I am and its very cool little radio.

73's,
Chris

no its not an extra load, it decreases the load to the amp.
Anyway, its a nice modification which can be done easily.
Personally i prefer the modify the 100k resistor.

Whatever modification is done, the result is not very good.
If the lowest volume is quiet enough for indoor use, than the loudest setting is not loud enough for outdoor use. Its always a compromise. If somebody uses the UV-3R mainly outdoors, he should not do any modification.

I got the same error when I tried it on a laptop on my RS-232 programming cable along with a USB<>Serial adapter. In that occasion, I was using a USB<>Serial adapter with the "Prolific" chipset which I use with other programs. None of the available "versions" of the program seemed to behave differently in that regard.

I tried it on a different (desktop) computer with a "real" RS-232 port (e.g. a board plugged into a PCIE slot) and haven't had any trouble, so I haven't pursued it, trying the obvious such as a different manufacturer's USB<>RS-232 adapter with a different chipset on that same laptop.

Even though you can "click through" that error, it is NOT working properly and you'll never be able to program anything or read it from the radio.

774. An alternative to the Baofeng software?

Yahoo group: UV-3R (2011)
Date: 2011-07-12 01:59:19 UTC
From: tracyshaunroberts
Topic: 774 Message: 774

Hi all,

My new toy arrived last night and I have just started to explore it. The supplied software very similar to that supplied with the Wouxun 689 I bought a few years ago (i.e. awful) so I have started looking for an quicker way of programming the channels, probably by a quick program that will let me supply a list of channels as a CSV file and generate a .dat file I can load via the standard application. As a start I have begun analyzing the .dat file format and I've uploaded it to the files section. Has anyone else done any work on this before?

cheers,

Tracy VK3FTSR

Thanks for the pics.
what materials and how did you make a new coil? did you reuse the old coil or just trash it?

Most people recommend the Nagoya NA-701 for a dual band antenna.

Since I had a Wouxun and was very happy with the Commander software, I went to the KG-UV Commander group and made a suggestion for just that:

http://groups.yahoo.com/group/KG-UV_Commander/message/162

Unfortunately the folks who responded practically ran me off the board because they did not like the non-FCC certified radio. So I asked another way and all I heard back were crickets:

http://groups.yahoo.com/group/KG-UV_Commander/message/168

Perhaps our interest in numbers will generate more interest from the developers.

Just a thought.

FWIW I took a Nagoya NA-666 to Disney World. Took a good beating around my neck for a week and survived well.

Bought mine on ebay for less than $10USD shipped. Received it in nine days from China in a small envelope but unfolded nicely when unpacked. I have no connection with this company, just a happy customer.

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=180666355351

Good luck.

Hi Sean,

I ordered it on the 30th June and it arrived on the 11th July. I ordered an SMA to BNC adapter a day later and it arrived last week. I used the 409 shop as I have dealt with them several times over the past few years and not had any problems. The favorable exchange rate between AUD and USD helps too.

Cheers,

Tracy

Perhaps it would be useful to get UV-3R support incorporated into this:
http://chirp.danplanet.com/ .

I use a 666 on my 3R and I am very impressed with it. It works at least as good as other antennas of that size I have tried and it looks better on the radio than the 701.

Very interesting, Julian!!! I'll ask if they want to support the FT2500M
(not programmable? See here:
http://causandodefeito.blogspot.com/2009/12/hackeando-opcao-de-clonagem-do-ft-2500m.html).

As soon as I get my UV-3R, I'll monitor the serial stream when
programming the radio and decode it, I think I can have some luck on that :)
and will supply the chirp guys all the info they need ;)

I did a bit of inspection of the data file for the UV-3 and determined that it's pretty much a map of the radio's EEPROM with a header in front of it. As it turns out, the Baofeng software has a reasonable built-in utility that allows one to look at (but not modify, from what I can tell) the EEPROM's contents. To do that, I used just a standard freeware HEX editor that I found somewhere and was able to the files produced by the Baofeng software.

For the heck of it, I did a bit of sleuthing and determined *most* of the data format of the memory and configuration bytes and bits in EEPROM - mostly to determine if there were additional parameters that might allow tweaking of some aspects of the radio and its DSP engine (I was looking for a memory location storing the PA bias, for one...) but didn't find it.

If you are interested in what I have, I can supply it, but it's pretty trivial to figure out.

One thing that I did notice was that it was possible to "blow up" the Baofeng software by setting a value in the radio's EEPROM that, when read back by the program, caused it to exit with an error: I simply reloaded a previously-saved .dat file and rewrote the radio without reading it.

Yeah, unless radios have the appropriate FCC id, you can forget about
any Commander software. He won't write for an "illegal" radio.

It is doubtful the uv-3r will get Part 90 acceptance, since there is no
provision to lock out direct frequency entry/menu access. It *could*
get Part 15 approval and then be sold as an amateur rig, if it is within
tolerances.

I've been using a Diamond SRH519 which is very similar to the NA666; very good performance.

Also worth a try is the Diamond SHRF10 (or the Maldol equivalent MH209SMA). 3" tall and very flexible, these work quite nicely for such a small antenna, simplex or on a good repeater.

Yes, that sounds pretty much the same as what I found. I also found the EEPROM viewer **after** I read the file with a hex editor. Because it simply appears to dump and write the ROM I doubt there is any chance of live managing the radio. The CHIRP project looks promising. The author has done a far neater job than I am likely to manage as I tend to write quick and dirty code to do a particular job rather than user friendly applications. I'll need to load Python on this PC before I can look at the format of the libraries for particular radios.

I think I have decoded the last portion of a channel record:

00 75 53 14 00 00 50 90 28 0A EA FF 00 25 44 43

In this example the channel has a VHF/UHF transmit/receive and you can see the last 4 words are the UHF Freq 434.425. I should now have enough info to be able to build channel entries to insert into a dat file.

The software writer is free to write whatever he want's.

Just remember that the radio is not "illegal" in many parts
of the planet.

Personally I find the supplied software to be perfectly ok.

Much better than the original Wouxun junk.

The manufacturer supplied software does not appear to program the FM broadcast memory space. Therefore any programming via PC wipes all FM broadcast presets including the frequency monitored just before programming.

The UV-3R carries a CE mark and claims compliance with a list of ETSI standards. I took a quick look at them and it appears that the VHF harmonic emission observed would indicate otherwise. Has anyone picked up on this or perhaps I may have misinterpreted the standard?

Since there is an unpopulated pad in the LPF, the spurious emissions were perhaps tested with the full filter in place. The mods described here make it accceptable for the ham bands. The radio seems to change frequently so who knows if the next rev will be different.

Sure he can write whatever he wants... He does not want to do
anything for this radio until it is "legal" in the USA, where he lives.

Personally, I am intrigued by this little radio, and am reading this
forum intently. Ordering and using one is certainly in my near future :)

The original Wouxun software is not bad... although the Commander
software does make it look like junk :)

Well that's true, but should you be worried ?

It's childsplay to program them by hand, and there's only 15 of them ;-)

Once they're in, just save the .dat file, which of course also
saves all your other working memories and you can easily reload
them later.

I refused to use the Wouxun thing, but the Commander made it
childs play.

Personally I rarely use any programming software, I have a bit of a
hatred for it.

The only time I've ever been glad of programming software was for my
VX7, and I'm glad he made the Commander for that too.

Some functions of the Wouxun REQUIRE software... but the Commander series is awesome. I know lots of people who use it for various rigs.

Commander didn't work with my Wouxun for i while until I reprogrammed the entire thing by hand on Commander... Evidently, there was a bad bit somewhere that bricked the radio using Commander... who knows... maybe the Wouxun software added some funny stuff... since I was the only person to experience the "bug" I decided to start over. Now all my radios are happy :)

If the UV-3Rs get FCC approval, and become as popular as they seem to be becoming, perhaps there will eventually be a Commander package too. I had heard *somewhere* they had submitted an application... do not know if it is true. Don't know where to look under, since the brand name didn't come up under an fcc search.

797. Current consumption during power save

Yahoo group: UV-3R (2011)
Date: 2011-07-13 19:49:59 UTC
From: dg1smd_1
Topic: 797 Message: 797

Hi all,

after programming the radio with the "power save" on both in the menu and in the software, I measured the current consumption with a shunt resistor and scope. Here are my findings:

t=0ms: current rises from 4.5mA to 16.5mA
t=105ms: current rises from 16.5mA to 66.5mA
t=265ms: current falls from 66.5mA to 4.5mA
t=615ms: cycle repeats

(105x16.5+160x66.5+350x4.5)/615 gives an average current consumption of 22.7mA. This gives a maximum standby operation time of about 52 hours for the 1200mAh cell - not bad!

While I was at it, here the results for LCD backlight: 8mA
and the torch: 25mA.

All measurements were done with an external lab power supply set to 5.4V to compensate for the voltage drop of the polarity protection diode. RX frequency was in the UHF band, squelch closed (otherwise no power save...).

I measured a charging current of 370mA. The components list in the file section is wrong: the charger is an LTC4054-4.2, not the L-type!

My radio is an 18-menu Comtex bought at the Friedrichshafen Ham fair a few weeks ago.

Greetings,

Rainer DG1SMD

798. Current Consumption When Turned Off

Thanks for allowing me to join the group.
My new UV-3R draws current from the battery, even when turned off. The radio works great except for this problem. With the radio off, the display blank and the flashlight LED dark, the radio pulls 210 ma. Turned on, with the squelch set and no receive signal or sound from the speaker, the drain goes up to 280 ma. The only other problem, that I am aware of, is the battery will not charge to full voltage inside the radio. The battery does charge up to 4.1 volts in the external charger. Has anyone else observed this problem and maybe found a solution? Thanks and 73's

Yes 210 ma!! I powered the radio by clipping my regulated bench supply to the two battery contact clips. The supply voltage was set to 4.0 VDC. Of course the battery quickly runs down inside the radio with the UV-3 turned off.

Then why does my radio still turn on and function a week after
its last used without being charged!

You cannot be serious?

Reg,
I sound like you, and most other UV-3R owners, have been blessed with a good radio. I suspect a problem in the internal battery charging circuit. I keep hoping someone else might have some experence with the problem.

Hi,

at first I used the battery "out of the box". Without charging it, because it already showed three bars.
It worked like two weeks before I had to charge it the first time (while I was testing nearly every day).
After the first charge it showed "4.1V" while turning on.
And since them I'm using it again. This week it has been completely off and the battery still shows 4.0V...

I got both accu versions (first one (shipped in very colorful carton) had 4.44 Wh, new one (b/w rather simple carton) had 5.55 Wh).

Looks like someone else had a problem like this... I saw a mod for removing a cap from the power circuit and I am guessing the cap was leaky, discharging the battery. Download the schematic and look at the power supply circuit; lots of components to go south.

809. Second harmonic at low power actually higher/change low power output.

Yahoo group: UV-3R (2011)
Date: 2011-07-14 14:16:41 UTC
From: Edwin-
Topic: 809 Message: 809

Hello All,

I just received my Baofeng by mail today. First of all I cheked out the harmonics at VHF, 2nd harmonic was quite bad. When I cheked it at low power, it even got a lot worse.
I placed a picture of my test (baofengtest.gif)in the files section. (Tried pictures but gave a bad image)
You can see on the harmonics test, an even better perhaps in the spectrum monitor the second harmonic even gets stronger! (About 3.5dB)

If you see my measurements, it is quite clear low power output has dropped quite a lot after modification. Only 20mW, I'd rather have a few hundred milliwatts at low power. Did enyone ever attempt to increase the low power setting?

With kind regards,

Edwin PE1PWF

Hee Edwin !

Welkom hier in de groep
Welcome in the group.
Did you perform the harmonics mod?
I used 33 pf but have no equipment to do any measuring.
And I always use 2W exept on a hamfest, Then a few milliwatts will do just fine...

I've just done a quick test.

Firstly I have done the 33pf mod.

I then had an rx tuned to 290Mhz, Baofeng tx on 145.00Mhz.

My harmonic is LOWER in the low power position.

I will recheck these results later when I have a fully charged
battery, since mine is nearly exhausted.

I did not chek it on a receiver yet, the harmonics test and stectrum dusplay gave quite a clear view. Anyway, it is wise to do the modification I guess.

About the low power, which is realy low, Cant find how it switsches to low power. Probably he signal is already lowered in the RDA1486 IC.

Anyone any ideas about this?

Edwin

I have rechecked my UV3R with a full battery. Same result.
Harmonic DOES reduce on low power.

> Anyway, it is wise to do the modification I guess.

Agreed. A tiny price to pay for a performance upgrade.

> About the low power, which is realy low,

50mw with 33pf mod I found.

Just think of how much battery power you save when you only
want to talk a short distance ;-)

It's a $50 rig, feel happy...

I agree, but low power now is very-very low power.

As far as I can see power output is set by the PA-bias output of the radio chip.
The only way to change this is changing the setting send by the cpu. This would meed some "reprogramming" of the radio chip, probably by changing the values with an software adjustment tool. Or there should be some hidden menu for adjustemnt, but I guess that would have been found by now.

About the second harnoincs, this should probably better be trapped before entering the PA, and not in the LPF, unfortunately it is all too tiny to create an extra RF trap in this unit.

Edwin

822. Programming the UV-3R

Yahoo group: UV-3R (2011)
Date: 2011-07-15 14:35:52 UTC
From: dl4aas
Topic: 822 Message: 822

Hi,

I'm new on the list, my plan is to use the UV-3R for rare automated transmission of voice and APRS.

Would be fine to be able to change the frequency using a microcontroller. It could be done by simulated rotation of the knob - but without an absolute reference it is a bit risky.

Another way can be the programming feature, the data set contains the active frequency.

Has anybody traced the serial programming process? My UV-3R hasn't arrived until now...

It looks exactly like the one I got possibly from the same seller which I have checked out and it works very well indeed.

The one to avoid is the NA-401 which I got because it is even slimmer but the resonant point is well out of band and it is a dog by comparison.

826. Re: uv3r Chopping, clipping, cut audio

Yahoo group: UV-3R (2011)
Date: 2011-07-15 18:33:55 UTC
From: Edwin-
Topic: 805 Message: 826

It seems there are quite a few people having these problems. I tried to read all messages about it, unfortunately did not find the fix.
Using CTCSS, opening the squelch (Level 0)and setting the receiver to WIDE are the options found

I always use the radio in Wide mode, I even tested this a 25Khz deviation level from the signal generator is still received.
At narrow it stops at about 4.5 Khz.

With squelch open there is no chopping.

When I input the signal from my radiotestset there is no chopping.

One could conclude the source of chopping is external so I ran the spectrum analyser to see what other signals I could find, nothing seems to be apearing there when the chopping occurs.

When I generate a RF signal near the radio (so no direct connection) enabeling the reception of other signals. The radio seems to chop, but not nearly as much as when I hear the local repeater.

Then I decided to inject my signal direct again, and alter the testtone, when I rapidly change the tone from lets say 200-2000 Hz and back (50Hz increments) I can hear the chopping almost every time when I pass a frequency of about 1100 Hz (mos occurs at falling tone.

As far as I can see this is not caused by an external signal, just seems the squelch detection get in to troubles somehow.

Please any suggestions!

I had my first 3 contacts on AO-27 satellite this afternoon shortly after noon central time with my UV-3R on high power with an antenna based on a design by Kent Britain -- WA5VJB I built. Great little radio and it was a whole lot of fun.

Hi,

I bought the antenna from this supplier about a month ago. Not sure whether antenna is real or fake; however, I am happy with the purchase. I commented earlier here:

http://groups.yahoo.com/group/UV-3R/message/777

Best of luck to you.

Pics already posted in the photos section.

UHF Performance:
http://groups.yahoo.com/group/UV-3R/photos/album/1646894722/pic/1005947653/view

VHF Performance:
http://groups.yahoo.com/group/UV-3R/photos/album/1646894722/pic/2050367022/view

While everything can be made counterfeit, I think it is more likely to find a fake Diamond than Nagoya. Just a thought.

How do you do reset the uv-3r? I have loaded ham frequencies and end up with 148.5A0 , 148.1 0 , 149.2 9 , 147.5D0 any suggestions?
Spence

835. Measuring 2nd harmonics modification VHF 136-174Mhz watts and dB 33, 39 and 47pF

Yahoo group: UV-3R (2011)
Date: 2011-07-16 08:11:34 UTC
From: Edwin-
Topic: 835 Message: 835

Not sure what capacitor to choose? Look at my measurements.

Baogeng UV-3R radio

Measuring output power and secon harmonic @vhf
Power in watt
Harminc suppression in dB (@high power)
Measured with Marconi 2945 (harmonic analysis)

Original

Freq	High	Low	2ndH
136	1.73	0.06	-21.5
140	2.09	0.09	-19.3
144	1.86	0.07	-23.0
145	1.88	0.06	-26.3
146	1.88	0.06	-29.1
150	1.81	0.13	-40.4
154	1.61	0.33	-51.4
158	1.52	0.49	-57.4
162	1.46	0.60	-60.3
166	1.50	0.70	-60.4
170	1.59	0.77	-59.7
174	1.65	0.82	-60.7

Modifications done with 805 SMD capacitor,
All values are measured on the same radio, full battery.

47pF

Freq	High	Low	2ndH
136	1.46	0.01	-30.4
140	2.22	0.01	-35.5
144	2.11	0.02	-41.4
145	2.01	0.02	-42.3
146	1.93	0.02	-45.8
150	1.60	0.08	-51.9
154	1.37	0.20	-55.6
158	1.23	0.31	-58.5
162	1.12	0.39	-57.5
166	0.99	0.42	-58.2
170	0.78	0.43	-57.0
174	0.53	0.34	-55.7

39pF

Freq High Low 2ndH
136 1.49 0.01 -29.0
140 2.21 0.01 -34.7
144 2.10 0.02 -40.4
145 2.01 0.02 -42.0
146 1.91 0.03 -43.1
150 1.65 0.09 -51.9
154 1.42 0.22 -56.7
158 1.30 0.34 -59.0
162 1.19 0.38 -59.7
166 1.10 0.46 -58.8
170 0.90 0.48 -58.5
174 0.64 0.38 -55.2

33pF

Freq High Low 2ndH
136 1.52 0.01 -28.1
140 2.04 0.01 -33.5
144 2.06 0.02 -39.6
145 2.01 0.02 -40.8
146 1.99 0.03 -42.5
150 1.68 0.10 -51.4
154 1.47 0.23 -56.2
158 1.34 0.36 -57.6
162 1.25 0.45 -57.5
166 1.18 0.54 -59.3
170 1.00 0.52 -57.9
174 0.73 0.44 -56.0

I hope this was of any use to you.
Output powe seems to increase a little, but not for low power.
47pF gives best 2nd harmonic attenuation, but lowers the low power output a little more than 33pF

I'll stick with my 47pF capacitor I guess.

Regards,

PE1PWF

836. new uv3r

Yahoo group: UV-3R (2011)

From: pe3hmp
Topic: 836 Message: 836

BAOFENG UV-3RWell I have since thursday an uv3r, new version with 18 menus in it, measuring it with a spectrum scope (pe0ssb design) did not work, ah well need a real spectrum analyzer for that I guess.
The odd thing I came across is when I wanted to program memories by hand, I only had 20 places to putt them for vhf/uhf and 15 for the radio, very strange, I solved that by programming the uv3r with the usb cable (just 8 random freq. in the list from 1-9) and suddenly I had 99 memory places.
It took me some while to figgure out why the programming did not work, eeeh my mistake cause I did not set the comport to 6 for the usb modem.
All in all it works nice, still thinking about the harmonics mod and a realy short antenna like the diamond but I hav eto be sure it is the real one, have not seen them at the 409 shop.
And the narrow/wide ?? does that only affects RX ?
Mark

On Ebay jingcairensheng is selling a poor counterfeit Diamond antenna also.

My measurements: VSWR at 2m is >20; at 70 cm =10. Do not buy this antenna.

Since we are on the topic, I just bought a stubby antenna

http://www.409shop.com/409shop_product.php?id=103094

I got better receive signal strength from the off band antenna that same with the radio.

Doug

I have one like that, though I didn't get it from 409 Shop who I thought was a decent seller (can't remember where I did get it either, but it was cheap.)

My antenna analyzer couldn't detect an SWR dip anywhere up to 200MHz (its maximum range.)

Basically the same as I bought below.

http://www.409shop.com/409shop_product.php?id=103095

I mine apart a few days ago.
It was just 15 turns or so of wire and that was it.

It provide a fair match at 2m, and useless at 70cm.

From: Doug and Shawnna Gugler
Topic: 818 Message: 845

Does anyone have any good recommendations for an inexpensive dual band antenna that is about the same size as the stock single bander.

Since this is a $50 radio, I am not wanting to spend $20 on a name brand.

Thanks

Doug

Why not? The radio is good enough, why not to use a quality antenna?

An antenna with good properties and such tiny dimensions, you will not find it. Except that it is not possible in any physical way, this antenna would be the absolute ham hit and just because of that surely not the cheapest!
I'm using an original Nagoya NA-666 and about size and performance ratio really satisfied!

Nagoya 701 works great or if you don't mind a telescopic one (with plenty of gain) I got one for under $10

Buying a Baofeng is the same philosophy. Value versus brand name. If you want value there is the UV-3R for $48. If you want brand name there is the Yaesu VX-3R for $169. To me the choice was obvious. I plan to get more UV-3R since I have several other hams in the family.

Getting a Diamond or Comet when there are companies like Nagoya seems like a violation of the value versus brand name philosophy mentioned above.

I have uses the NA-701 and NA-702. The NA-702 is 26 cm and could not tell the difference in performance over the NA701. I found the longer length to be cumbersome and with no measurable difference, I stuck with the smaller antenna.

854. Dual Band antennas

Yahoo group: UV-3R (2011)
Date: 2011-07-16 21:40:08 UTC
From: g8dor
Topic: 854 Message: 854

I have recently got a UV-3R and I am very impressed with the price/performance ratio, especially the stepped DSP noise reduction on weak signals.

I also have an Icom IC92D and was disappointed with the performance of the stock FA-S270C antenna that came with it, so I bought a Nagoya NA771, which is very good on the IC92.

Out of interest, I tried the Icom antenna on the UV-3R and it works very well into all the local repeaters. Better in fact, than the single band Baofeng whips.

Oddly, when I tried the NA771 on the UV-3R, it appeared no better than the Icom antenna, although it is significantly better whan used on the Icom.

I offer no reasoning, just the observation which I hope may be of use.

Thanks to all the other contributors by the way. I did the 22k audio level mod and it is much better now

Hi,
It's very pleased to see the discussion around here.
Few frend of mine buy UV-3R after seeing my review on local forum, but
one of them says he's got different adapter
Can anybody confirm what wallwart/charger/adapter they got?
some got with the charging control (LED on right bottom side)
but I've check mine, theres no LED around it, and after dissasemble it
miss component that conected to that LED

Thanks
Ariandi

Hi,

Got five UV-3R (three for my friends) since the beginning of June and the last one arrived just Wednesday. But none of them had an "intelligent" charger...

There were many differences between the first and the last one (e.g. the first was packed in an extremely colorful package with thousands of chineese signs on it (hihi) and only 4.44Wh battery- already the second one came in a rather neutral carton and the last ones had a bigger battery (at least the Description now claims 5.55Wh)).

From: pe3hmp
Topic: 860 Message: 860

BAOFENG UV-3R
I have several antennas, I bought my urv3 with a dualband antenne included(18 cm long), I have no idea what kind of brand that dualband is.
I tried it with the original 2M antenna, 70cm antenna, the included dual band antenna and my old diamond SR771(with adapter).
The diamond SR771 beats them all but with a lenght of 37cm it is too long.
I’m waiting for a fellow ham to lend me his original diamond stubby (do not know the type) to see what that does.
Still looking for the best antenna that is shorter than the 18cm dualband one.

863. Re: Unsupported operation was attempted

Yahoo group: UV-3R (2011)
Date: 2011-07-17 15:01:36 UTC
From: andyfoad@rocketmail.com
Topic: 761 Message: 863

Well I'm glad you did Robert.

I purchased a nice little cable set from 409 shop that covers
a multitude of rigs. Only problem was there was no drivers for
Windows 7/64.

I had to "borrow" my partners XP laptop, but now I can use my own ;-)

864. Mine arrived

Yahoo group: UV-3R (2011)
Date: 2011-07-17 15:40:23 UTC
From: mchenryproj
Topic: 864 Message: 864

Pics in the photo section under my call, KB8JNE. Pic of the arriving package and the contents. My only initial concern was a spec of large dust behind the face. I got it out by removing the back, the 2 screws from the sides, the top main dial screw and knob then pulling gently up on the bottom of the radio itself. After the bottom of the radio was free I wiggled it downward and it came open enough at that point that a can of spray air got the offending lump out. I am pleased with the ease of programming overall manually. I have yet to open the CD as I already had the manual downloaded. It is an 18 menu setting version.

I bought this radio primarily for my father as he is interested in getting involved and reading the manual again. I set it up with the local repeaters and even some satellite and FRS freqs to monitor only, for now, till he gets his license. If he gets his license by Christmas the radio will be his and if not I'll have it back to pass on to some other prospect I suppose. Makes a small cheap monitor radio if nothing else.

Topic: 607 Message: 865

My wall wart charger has the LED indicator built into it. Just got mine last week. See the pics of the packaging and the contents under my call KB8JNE in the photos section. No LEDs in the charge base but I won't likely use the charging base anyway as it isn't a drop in type.

While charging the LED on the wart is red. When charged it goes green. I have to assume (yeah, I know) that it is a charge controller type since it can tell the charge and change LED colors. It corresponds with the charge indicator on the radio.

From: Roberto Ferrari
Topic: 860 Message: 866

I found the stock (UV-3R) VHF - UHF antennas to be very very good.
In fact the UHF antenna is better than the VX-3R dual band..... even for
VHF.
The Nagoya 701 dual band antenna works really good for me, I think it's under 18cm

I have several antennas, I bought my urv3 with a dualband antenne included(18 cm long), I have no idea what kind of brand that dualband is.

I tried it with the original 2M antenna, 70cm antenna, the included dual band antenna and my old diamond SR771(with adapter).

The diamond SR771 beats them all but with a lenght of 37cm it is too long.

I’m waiting for a fellow ham to lend me his original diamond stubby (do not know the type) to see what that does.

Still looking for the best antenna that is shorter than the 18cm dualband one.

Hi,

I thought you meant a charging LED in the desk-charger. So I rechecked the Wallmart, but there are also no LEDs.

The regulation for charging the battery is done by the wallwart, right ?
You can't over charge it, right ?

Hi,

Got five UV-3R (three for my friends) since the beginning of June and the last one arrived just Wednesday. But none of them had an "intelligent" charger...

There were many differences between the first and the last one (e.g. the first was packed in an extremely colorful package with thousands of chineese signs on it (hihi) and only 4.44Wh battery- already the second one came in a rather neutral carton and the last ones had a bigger battery (at least the Description now claims 5.55Wh)).

Well, we need to REALLY FIND the manufacturer and then look it up on the FCC website to see if for one, there is any FCC ID, and two: see if there are any pending applications.

This radio is sold under so many brand names, it is hard to find who really makes them.

My UV3 is now roughly one month old and was not used much.
Yesterday i switched it on and found the left side of the display is fully activated and shows all the possible characters. It disappears after say 30 seconds and operates as it should be. This can be repeated.

Anybody out there experienced the same ? Is there a solution ?

Mine has done exactly this same thing from new. I have seen similar problems on other bits of kit (portable radios, DVMs, clocks etc) and has seemed to be down to a static charge building up on the faceplate of the LCD (I don't know why that affects them but it does). After a couple of seconds it's all ok again but the longer it's left off the longer it seems to take to come back to normal.
Early Yaesus (FT290/690/790) were known for crap LCD reliability but at least the UV-3R seems to recover.

Hi, i observed this issue several years ago with others HT.

For example my old Icom W2 works very bad with the Yaesu YHA-28 antenna, but this antenna works well with others HT.

Reason? I don't know too.

I've had it a few times.

Disappears in a few seconds to a perfect display and never causes a problem.

Doesn't seem to be doing it recently, so I doubt it's anything to worry about.

Sounds like the clock in the display chip is off to a slow start. Replace
the display chip on the PC board under the display.

My UV3 is now roughly one month old and was not used much.
Yesterday i switched it on and found the left side of the display is fully
activated and shows all the possible characters. It disappears after say 30
seconds and operates as it should be. This can be repeated.

Anybody out there experienced the same ? Is there a solution ?

I found out that the dual band antenna I got with the uv3r is a A3SM-UV, the NA701 is 20,5cm long if the info on the internet is correct

Looking more for a lenght that my TH79 uses, about 11cm long, I have seen a piture of an urv3 under another brandname with an antenna with a orange dot on the top that looks like a nice lenght, wondering how good that works.

884. Recieved the UV-3R today, ready for modding.

Yahoo group: UV-3R (2011)
Date: 2011-07-18 11:59:33 UTC
From: warrenrockley
Topic: 884 Message: 884

Well it came today, shipped from Hong Kong on Friday evening, arrived with me in the UK Monday morning.

The volume seems perfectly fine to me, maybe it has been rectified in the factory now?

I have ordered blue LED for the backlight, Capacitors for the low pass mod and resistors for the (possibly un-needed) volume mod.

I have 50 of each and so I will have plenty left over if anyone wants their radio modding, or maybe trade some of the components for the power chip for the desk charger mod, which I have yet to buy.

I have had a look at the aftermarket FBA-37 I have, rather than modify the radio, I believe the holder can be modified to clear the clip bracket, thus leaving the clip able to be used when the battery holder is removed.

Topic: 890 Message: 890

Hi,
My UV-3R had the problem that once the battery was pushed in the ON/OFF button wouldn't work... In other words it wouldn't turn off.

I disassembled the radio to repair the button. As it turns out this wasn't a difficult task.

The button contacts are round snap disks that make contact from an outer PC board ring to the center contact on the board. These disks are mounted in a plastic strip that has adhesive on the board side.

I pulled back on just the section of the strip that has the power snap disk back and used a drop of Deoxit on a Q-tip to remove the finger print from the PC board contacts and clean the inside of the snap disk.

Although I was very careful about not getting any contact cleaner on the plastic strip or out of the switch area on the PC board, the adhesive wasn't sticky anymore. That doesn't seem to be a problem as the remaining 3 snap disks weren't removed from the board and the plastic strip is holding the on-off button in place.

Also, I was able to modify my Wouxun programming cable to have a UV-3R cable in parallel and save myself $12 by using $200 worth of technical time. ;-)
(What lengths we sometimes go through just to be cheep!)

War tails; no extra charge.

From: john_kb0ne
Topic: 885 Message: 891

Not sure what your question is... the bi color LED on the wall wart simply indicates load (green) or no load (red). Besides the resistors, see photo (http://groups.yahoo.com/group/UV-3R/photos/album/1406968745/pic/list <http://groups.yahoo.com/group/UV-3R/photos/album/1406968745/pic/list>) , it looks like there is a transistor to switch the LED color.

If all you need is an indicator on your charger base to show that the wall wart is connected then a 1K ohn in series with a LED of your choice is a safe bet.

893. Transmit time?

Yahoo group: UV-3R (2011)
Date: 2011-07-18 16:08:29 UTC
From: mchenryproj
Topic: 893 Message: 893

Has anyone done a transmit time test yet? Curious to see how much actual talk time one gets out of these tiny batteries. I wonder because this am I was in a QSO with some friends on the local machine and toward the end of a 5-10 minute round table I was told my signal had gotten pretty fuzzy into the machine. I was using an SMA24 antenna on 2m at the time and was in 100% at the start with a fresh charge.

Anyone want to do a stress test at high and low power to see what sort of usable TX time we can expect. Not talking about 50% talk/receive, just how much key down time we get total. If you try this be careful of heat issues. Mine got warm but not as hot as some of my older HTs often do.

Well here's your answer:

- The battery is 1.4 amp hour (depending on what you read).
- The rig draws 1.4 amps on transmit.

Hope this helps ;-)

Topic: 903 Message: 903

I received my UV-3R last night and set it up today for VHF APRS. My test was on HI (2w or so) and NARROW using an external mag mount antenna and an OpenTracker +. Worked very well. I was using TX audio of 50% in the config program and the HI jumper removed. The HT jumper also has to be removed.
No you can't use cables for a Yaesu VX-3R; the socket is wired differently. I'll post my connection diagram when I make it readable :-) Should also work for tinytrackers.

Also, it's very easy to make an adaptor to use the the Wouxun/Puxing/Kenwood programmers to program the UV-3R. All you need is the four terminal plug as used for the UV-3R, a mono 3.5mm socket and a stereo 2.5mm socket to fit the programmer. I'll post that diagram soon as well. I successfully downloaded and uploaded settings using the above hardware and the software available on this group.

UV-3R to Wouxun Programmer.JPG
How to adapt programmers designed for Wouxun, Puxing, most Kenwood handhelds and several other chinese radios. The plug on these programmers is the double plug with one 3.5mm jack and one 2.5mm jack. Tested with success on Wouxun serial and Wouxun USB programmers with UV-3R software found on this group.

I'm fairly certain that you cannot use a VX-3R programmer nor can it be adapted because that programmer shares TXD and RXD on the same line, as do many other Yaesu and Icom programmers (IC-706, IC-7000. IC-208, FT-7800 and similar) You may get lucky and crack open the programmer and separate the TX and RX line, but not for the faint hearted

Note that the 3.5mm jacks that fit the UV-3R spkr/mike socket are not all the same. I wired one and it didn't work. I checked the wiring three times and it was definitely correct. There were small variations in the length of the sleeve and rings which prevented good contact.
I used the hacked off "free earpiece/mike" cable successfully, as well as an off-the-shelf connector that has a metal cover and is all gold-coloured (probably not gold plated though)

They can be difficult to solder. Use a fine tip and be careful of shorts across terminals.

I do it because I like to.... It's fun and exciting to figure out how things work and how to adapt other devices to do something they aren't supposed to.

Like I said in a previous post:

"Also, I was able to modify my Wouxun programming cable to have a UV-3R cable in parallel and save myself $12 by using $200 worth of technical time. ;-)
(What lengths we sometimes go through just to be cheep!)"

This is correct, even tried my VX7 cable and no-go.

> > You may get lucky and crack open the programmer and separate the TX and RX line, but not for the faint hearted

Or, like I did, split the Wouxun cable open about half way and wire in the TRRS plug. But I did take the USB case off first and it wasn't all that hard to do. Needed to see which wire was which.

Are you testing thr 2nd harmonic on 2 meters?
Do these meet spec -43dBc from the factory, or are you adding the missing capacitor in the LPF? That would be a great service.

I haven't trid but the TX should be fine, no? It' the RX that's dicey.
Since you can't turn off the RX Save you probably need to set the squelch
open and use the more complex busy detect some of the APRS modems offer,
rather than the simple AF off/on detection.

The one I have has a menu to turn off RX save. I also set squelch open
which is a must for reliable reception. Squelch is for humans :-)

And Kenwood APRS radios, and any TNC that doesn't support "Software"
("Smart", IMHO, as it actually listens for APRS tones) carrier detect
but simply bases clear to transmit on the binary open or closed status
of the squelch.

From: g3ypq
Topic: 931 Message: 931

Now I must declare an interest here as I supply these replacement antennas, but they are ideal for the any Handie including the UV-3R.
Its a rubberised Telescopic that extends to 1/4 wave on 2m and can be used with low SWR on 70cms either Fully down or Fully up.
On the UV-3R the LED and its surround is close to the Antenna socket so for these I shave off the rubber a little and it fits fine. It out-performs the supplied antennas without the need to change, and folds up nicely. I've been into handhelds since the crystal controlled KP202 and this things good, you can set it to exact 1/4 wave on marine band by telescoping the top section down.

Hi, I have a same failure, the radio turns on when I put the battery in and it cannot be turned off. I also opened the switch and left it open but still the radio behaves the same.

As I looked the schematics I found that the power switch just grounds one processor bus to ground via 1 kohm resistor, so I guessed that there must be some short circuit with the switch, but that is not the case, I measured with ohmmeter and the resistance across the switch was tens of megaohms???

What next, sending back to China is not an option because of postal rates.?

Answering to myself: Could it be that the mechanical switch is ok but the problem lays around voltage regulator U9, TCR5SB30 which seems to be the actual power switch at least to +3V bus? There seems to be a control signal REG_SW which controls the 3V output, guess I must check that signal when I get back home again.

For group interest neither the charger nor cradle for my UV-3R have any LEDs on them at all but it doesn't seem to over charge the battery, nor do either get warm while charging. Also despite the instructions for the radio saying that the TYX LED glows during charging mine does not instead I have a moving battery symbol on the display showing the progress of the charge.

The way the switch works is to *momentarily* contact the uProcessor input lead by shorting the line to ground. This connection is ALWAYS open except when pushing the power button to either turn the radio on or off. In other words the uProc is always monitoring the power request line, even when the radio is off.

Your best bet is to take a Q-tip and a tiny bit of contact cleaner or alcohol applied to the tip of the Q-tip and gently clean the inside of the snap switch dome and the PC board where it contacts.

It takes about 1 second or a little more of continuous contact to switch the radio on or off.

If it meets specs, I don't see why individual hams should be too concerned about FCC approval. Without approval we won't see it for sale in ham stores or major online stores, but then again that will only push the price up. At $49, the price is the charm if you can test it yourself. For $60 with the cable and LPF fix added and tested, even hams without the ability to add in the capacitor should be fine. But as far as a desire to buy one from a store for 30% more, frankly I'd rather buy a Yaesu on sale or used.

From: Edwin-
Topic: 860 Message: 942

I see a lot of info about antenna, which might be fake.

It still seems tricky to buy a cheap antenna.

Checking the nagoya website I could not find model numbers like NA-666 maybe this is an indication for cheking for fakes.

I must admit I did not suspect people selling fake antenna's i just bougt a model 666 a few days ago, from which seems a UK seller on ebay.

Hope it seems to be a working antenna, still waiting on it to arrive.

Regards,

Edwin

I've cleaned the contacts, no effect. Besides, dirty contacts wouldn't explain why the rig turns on immediately after inserting battery. So I thought there could be a permanent short which grounds the power request line, but I cannot confirm that. The uP lies under display which is hard to disassemble, so one cannot measure directly on uP:s legs. And the circuit board seems to be multilayer type, so one cannot follow the routes. Tough case!

That would definitely be nice to know. I have run mine with 5.5V into the DC IN jack WITHOUT the battery installed.. I'd rather not risk a battery fire until we know for sure. I monitored output power and it increases with increased voltage. Obviously the supply current must be available as well. That was around 1.3 amps on TX at 145MHz

From: mikekane19
Topic: 948 Message: 948

I just received a UV3R radio by registered mail from www.radiogearpro.com . It cost me 56 dollars included charger two antennas software cd and program cable. The radio is very good for a reasonable price. I had no problem installing the program software and programming the radio also.,but I had to download the usb driver from this groups files. The drivers on the included cd didnt seem to work right. Its a real sweet little dual band ht. I like it a lot.

I just got a brand new uv3r in the mail. I noticed when I put the battery in the radio it would turn on right away. Maybe all the radios have this issue. Perhaps a design flaw.

The thing is it doesn't meet spec... at all... even with the capacitor mod. Even if the cap mod is able to reduce the 2nd harmonic to -40dBc (I haven't seen anyone report that it works that well) the 2nd harmonic is still above the 25uW maximum. Have I missed something? Is there a mod that gets the 2nd harmonic to -42dBc or better?

The limiting factor looks like the TCR5SB30 voltage regulator which has a maximum input voltage of 6V.

They are connected direct to the battery and to the charging input via a M1FM3 Schottky diode that will drop about 0.4 volts.

The non-combustible limit I would suggest is 6.0V on the battery contacts and 6.4V on the charger socket.

I did the SMT mod and measured the 2nd harmonic as -48dBc to -52dBc. See http://wa5znu.org/2011/06/uv3r-lpf/ for pix from my spectrum analyzer. At 2W out that is between 12 and 33 microwatts. With the antenna on, there is not going to be any energy at the 2nd harmonic.

NO. Those pics was inside of transformer WITH dual-color led.

Red when charging and greenish color when its full.

Sorry not to point out that clearly in pics.

PS. In pic one of LED's leg is outside of tube and two legs inside the tube it's standing.

An HP 10MHz-22GHz analyzer. It's not a commercial lab and I haven't had it calibrated for power. HP 141T mainframe, and the microwave RF section. I have seen them at hamfests for $500.

For frequency I use GPS-DO but that's not an issue here.

It is a frequency standard using GPS so it gives 10Mhz very accurately. I used it as an external ref for my counter to get the frequency of TX and found the UV3R to be off by only a few Hz on 2M, so I was impressed with the quality there.

Measuring the 2nd harmonic doesn't require that level of accuacy bu I did use the external reflock on my 1GHz HP signal generator to generate a pip at the second harmonic and verify the coincidence on the spectrum analyzer.

Gary,

Is it possible that the parts list and/or schematic changed? Perhaps they have a new rev PCB just as fast as they updated their firmware from 12 to 18 menus.

Maybe the speed of their improvements will surprise us all...

To know that it is normal that the radio turns on when battery is being inserted was important information. I got a change to look at the radio with a stereo microscope and I discovered that there was a patch of clear lacquer on surface of inner circle of the on/off switch. It was very hard and had to be scraped away with a knife. Alcohol and contact cleaning solvent had not melted it away and it was impossible to see the lacquer with magnifying glass.

But that didn't solve the problem, the radio wouldn't still turn off. By accident when the cicuit board was loose, the four Phillips screws were removed and power was on I discovered that by pressing the circuit board with finger the radio would turn on and off. I fastened the screws loose, the same thing. But now also the on/off switch worked also! I fastened the screws one by one and a bit by bit until finally all screws were tight. And the on/off switch didn't work again. Then I loosened the screws one by one and ...breakthrough, as I left the screw on lower left corner a bit loose and the rest three were fastened tight the radio and the on/off switch work as they should. I assembled the radio and it works ok.

So, happy ending. The big problem was that there were two faults, the lacquer pad and some mysterious break somewhere in the circuit board. The latter still remains but I hope it will not be an issue in the future. Thanks to all of you who helped with this problem.

I do not necessarily disagree with your statement about falsification. That said, I think it is a good idea to offer verifiable evidence of this going on.

Is part 15 cert necessary if part 90 appears more stringent? If so, the Wouxun and many others with part 90 but not part 15 are out of compliance as well.

Just a thought.

I just noticed in the FCC approval documents a "Justification" letter that states the transmitter on the radio supplied to the FCC for part 90 approval cannot be programmed by the end user (it can only be programmed by the manufacture, service or maintenance personnel). I don't have one of these radios, but I assume you guys are able to program the TX frequencies using the controls on the radio, so it sounds like they changed the firmware for the part 90 radios.

Topic: 871 Message: 976

Leigh,

Thanks for taking the time to share your measurements and do such a good write up. With the UV-3R they seem to vary quite a bit from unit to unit. There are 3 of us in town with these so it will be interesting to see how they vary before and after the mod.

I have access to a Agilent E4445A that's only a week or two out of cal, I plan on using this to test the ones we have. I'm also going to put the schematic into spice and see if I can maybe tweak the whole filter, with the added cap, and get it any better.

While I agree with an antenna that almost no harmonic will be radiated, the law does state: "For a transmitter having a mean power of 25 W or less, the mean power of any spurious emission supplied to the antenna transmission line must not exceed 25 µW and must be at least 40 dB below the mean power of the fundamental emission, but need not be reduced below the power of 10 µW."

Am I going to call the radio police? Heck No! I'm just saying what has been done so far is a HUGE improvement, but lets not settle there. Lets try to improve on this one solution to meet the end goal of "not exceed 25 µW and must be at least 40 dB below the mean power."

73 and keep up the good work everyone!

Hi Friends,

Part 15 certification ("Unintential radiators") is not required for a Part 90 certified ("Intentional radiator") device. That's why if you do a search of the FCC equipment authorization, you will find no authorizations with both Part 15 and Part 90 authorization going back to 2001.

I read that too. I wonder how that is possible. All I can figure is they included a way under software to disable menus. The owner's manual presented in the exhibits, still mentions end-user programmability.

We will see... at least they got approved, so I imagine sales will increase hundredfold... and price wars will begin... All the overseas dealers seemed to drop their proces on Wouxuns a lot, since they took off. Again, we will see.

Also, a USA dealer would be super :)

Topic: 693 Message: 985

Here is some more feedback.

After doing 15 of these pesky little buggers.
Removing C158 does not always bring the second harmonic another 10db down, as a matter of fact in about 50% of the cases it makes it worse.

I have noticed the the units made in June that the UHF second harmonic is very close to the legal limit.

Have not gotten hold of any July vintage radios.
And yes I know I should have taken pictures, on the next run I'll do that.

Has anybody played with changing the inductor values, although lowering their inductance (by opening them) would probably aggravate the problem.

It occurred to me yesterday that these radios cover the frequencies used by the NOAA weather satellites. I wonder if anyone has tried receiving them? Unfortunately the IF bandwidth will be far too narrow for the APT transmissions. But if someone could find a way to increase that in the DSP chip you could have a nice weather satellite receiver!

I have modded my radio now, added the 33uf LPF, have no real way of testing it but I have faith! It was a 0603 SMD component, very tricky to solder.

The volume is fine for me so no mods there.

I have changed the backlight to blue, also changed the Tx/Rx LEDs to blue as I bought 20 LEDs and wanted to use them up (and I like blue LEDs).

I have also opened up the Mic hole and I have noticed a difference in my received audio.

Photos in the Photos section.

I have modded my radio now, added the 33uf LPF, have no real way of testing it but I have faith! It was a 0603 SMD component, very tricky to solder.

The volume is fine for me so no mods there.

I have changed the backlight to blue, also changed the Tx/Rx LEDs to blue as I bought 20 LEDs and wanted to use them up (and I like blue LEDs).

I have also opened up the Mic hole and I have noticed a difference in my received audio.

Photos in the Photos section.

73s
Warren
M3HTH

Nice mod, still can not seem to get my hands on some blue leds in the Netherlands.

And does anyone know what speakermic will work on this urv3 ?

Can you solder tiny SMD components?

Yaesu VX-3R seems to work.

Hi all,

I've just uploaded a serial port capture of the reading of the UV-3r with the standard software. It is pretty simple as it just dumps the eeprom block by block.

Cheers,

Tracy VK3FTSR

It looks like another knock-off of the kenwood protocol, just like the Wouxun and Puxing radios use. It should be pretty easy to adapt the existing CHIRP line driver (which works for both of the others) to work with this.

I've got a UV-3R on loan so I can add it to CHIRP. I would sure appreciate some help testing it from the folks here, once I have something working.

Thanks!

Hi Dan,

I am available to test CHIRP. There are at least two others I know who have the UV-3R who may test as well.

Please let us know when a version is available. The WinXP platform is most accessible to me.

1002. Easy build programming cable

Yahoo group: UV-3R (2011)
Date: 2011-07-25 16:51:04 UTC
From: g4ilo
Topic: 1002 Message: 1002

I made a programming cable for the UV-3R today. It was very easy. I used one of the USB/TTL/RS232 cables available on eBay. Just search for "PL2303" and look for what look just like USB cables with wire ends.

The converter chip is in the USB plug. At the other end of the cable are 4 wires, one of which is +5V. Cut that wire off, then solder the other three to a 4-way 3.5mm jack plug:

- GND (black) - base of the plug
- TXD (green) - first ring
- no connection - second ring
- RXD (white) tip

It was certainly a whole lot simpler than some of the circuits I have seen!

2) No, the VX-3R uses a 2 wire programmer (Ground and data), the UV-3R uses 3 wire (Ground TX and RX)

1) Not without adapting somehow.

I will send you a couple of LED, they are 0603 so 1.6 × 0.79 mm, the solder tags are about 0.10 x 0.79 mm you will have fun trying to solder them with an iron, I know that I did.

Support is added in today's build:

http://trac.chirp.danplanet.com/chirp_daily/daily-07262011/

This is a first stab and only represents a couple hours of work, but it seems to work for me. Feedback is appreciated, although I'd prefer it go to the chirp_users list if possible. Future fixes and enhancement announcements go to that list.

Thanks!

I've just given it a quick try reading from the radio. All the blank channels are showing the frequency 1666.666650, the other settings for those channels seem to be some default setting. The channels that were already programmed seem all OK though.

Okay, that means the other blank ones aren't as "clean" as in my radio.
Can you send me an image (privately) and tell me some of the ones that
should show as blank that don't?

Thanks!

1014. Chirp software working fine with Baofeng UV-3 R HT

Yahoo group: UV-3R (2011)
Date: 2011-07-26 17:47:57 UTC
From: Ken Simpson, W8EK
Topic: 1014 Message: 1014

I downloaded the new "daily build" of CHIRP software,
installed it, and tried it with the Baofeng UV-3 R HT.

I transfered the contents of the HT to the software, and
all worked fine. I added a few memory channels, changed
some things in others, and then loaded it back to the HT.
All seems to be working fine.

Thanks, Dan, for doing this.

From: tracyshaunroberts
Topic: 774 Message: 1017

Hi Dan,

Same issue here. Here is what an empty memory slot looks like:

Freqency,Tone Mode,Tone,DTCS Code,DTCS Pol,Duplex,Offset,Mode,Power
1666.666650, (None),88.5,023,NN,(None),0.000000,FM,Low

The exported CSV file is clean though. I will send you a copy of my DAT file. Interestingly, my programming cable is on COM14 but the drop down on CHIRP only goes to COM7. However, if I manually enter COM14 it works, neat!

Looking at the contents of the dumped DAT file after updating the radio, (i.e read radio from CHIRP, copy channel, paste into blank channel, write from CHIRP, read radio from Baofeng software, save as DAT file) I can see that you have implmented the VFOB frequency in bytes 0C to 0F. Creating a new channel does the same thing. As far as I can see the radio seems to ignore these bytes, (using the computed offset instead?). this looks like a problem with the UV-3R rather than CHIRP but it makes no difference to the radio operation.

No nasties so far.

Cheers,

Tracy VK3FTSR

Yep, already fixed for tomorrow's build.

Yep, as designed. I've got some code to enumerate the COM ports from the
registry on Win32 that I need to get in there.

Yeah, I have no idea what the radio is doing with those extra bytes, but
my guess is that the controller running this thing is using firmware
that has been stolen, copied, ported, etc from many other radios and the
person doing this one either didn't know or care :)

RFinder is a repeater database. However, I'd recommend you use the
repeaterbook import instead, if it has the data you want.

1027. New poll for UV-3R

Yahoo group: UV-3R (2011)
Date: 2011-07-28 05:49:15 UTC
From: UV-3R@yahoogroups.com
Topic: 705 Message: 1027

Enter your vote today! A new poll has been created for the
UV-3R group:

Which mods did you do to your UV-3R (not the charging base, but the HT itself)

o None. It is factory - No Mods
o A 2nd Harmonic Mod (any flavor)
o A Volume Mod (any flavor)
o A different color LED Mod
o Another Mod (not listed)

To vote, please visit the following web page:
http://groups.yahoo.com/group/UV-3R/surveys?id=2690148

Note: Please do not reply to this message. Poll votes are
not collected via email. To vote, you must go to the Yahoo! Groups
web site listed above.

Thanks!

I just got this from Carrie at Vero, I think this clears it up:

Dear Sir,

Good day to you!

Regarding the FCC approvals of our UV-3R,it is still in applying by our certificate authority.It will be got after next 10days.

We are the manufactures of UV-100 an UV-200.Comparing with UV-3R,they only the housing difference.So when our UV-3R get approval,they are unnecessary to apply FCC approvals again,please take note!

Anything we can do for you,please do not hesitate to let us know!

Thanks and best regards!

I don't currently. That function doesn't really translate to anything
else that CHIRP does right now, AFAICT. I'll try to take a look at it
before I return the unit I'm borrowing and see if there's a reasonable
way to integrate it.

Have a look at their web site:
http://www.vgc.hk/index.htm
Lots of interesting stuff coming such as a dual band mobile and a dual band handheld with keypad and full duplex!
When I enquired recently, they were still under development.
If you buy 100 then you can have them with your name on them!

Check and make sure the COM PORT is the same between the USB adapter, and the programming software

in Windows XP, it's
START
CONTROL PANEL
SYSTEM
HARDWARE
DEVICE MANAGER
PORTS (COM AND LPT)

see what com port it's assigned, the check with your software setting and make sure it's alos looking at the same COM PORT number

Good Luck

Look in the files section, specifically:

http://groups.yahoo.com/group/UV-3R/files/Diagrams/

If you notice the FCC application, the manufacturer requested that the schematic (and certain other docs) withheld from public view, citing trade secrets.

Hope this helps.

Kai (KB2TRW)

1041. PS2303 Profilic Driver will not 'Turn on'

Yahoo group: UV-3R (2011)
Date: 2011-07-30 14:48:59 UTC
From: Ron McKenzie
Topic: 1041 Message: 1041

Hi, All,

I am running Win7 64-bit Home Ed. I tried installing the versions from Files (here), the version Bob N4NBC sent me, and the latest version from the Prolific website. In every instance, Device Manager under Device Status on the General Tab reports: "This device cannot start. (Code 10)".

What're some next steps I can try in my effort to run this to ground?

Each time I installed a different driver I uninstalled the previously installed driver version.

Thanks to Dan and Bob for advice and counsel given off-list.

Hi
My prolific usb runs just fine in win7 64bit sp1.
Its driver is version 3.3.11.152 if that helps at all. If that's your version try changing the com port number in the port settings tab of the driver in case of a hardware clash

1044. Reset /program radio

Yahoo group: UV-3R (2011)
Date: 2011-07-31 02:07:03 UTC
From: Spence
Topic: 1044 Message: 1044

The computer TELL,S me that it wrote to the radio. 12 channels Ham repeaters & 2 simplex But I have 136.00 / 173.995 for vhf & 400.000 /469.995 for UHF. I have tried a lot of times. I tried holding down , uv,menu,vol. and the F button and turning the radio on.
Battery voltage is 4.1
The radio will not accept the input when I write to radio.
Any suggestions?

Here is what the Prolific website has to say about the Error 10:

Q Why do I get an Error Code 10 (Yellow Exclamation Mark) after I
installed the latest driver?
A If you are getting an Error Code 10 with a yellow exclamation mark in
Device Manager after installing the latest Prolific PL-2303 driver,
please contact the cable maker of your product for Prolific chip
validity and support.

tnx,

Ron

I've seen a user review of it on transmission1.co.uk from a UK
user and it appeared to do as it says on the tin.

Small moan about loud receive audio but that was about it.

There's also a Spanish language review on Eham, which has said
nothing negative about it.

I've sold one so far from my shop. Didn't get much time with it.

It's interesting in that the "radio" portion snaps on the back. It looks like the device can be used as a cell phone when the radio is not required reducing it's size and weight.

I only wish I was able to spend more time with the radio to learn about all the functions.

Yes, the face of the phone controls the radio, and the PTT is on the side. The manual is available for viewing on puxings website, its the D03 I believe.

Leigh/WA5ZNU

---------- Forwarded message ----------
From: "Egbert"
Date: Aug 1, 2011 2:56 AM
Subject: Puxing D03

Hello Leigh.

I have one , but it is a D03 not the P-A 968 , but it is the same radio...

See:
http://puxing.en.alibaba.com/productshowimg/447653840-212394349/PX_D03_Cell_Phone_Radio_two_way_radio_mobile_phone.html

There is no name on the radio ,exept 'Puxing' below the LCD screen.

The CellPhone is OK , hold's 2 SimCards and a microSD Card , but they are not included , of course.

The FM radio works only with the earphone atttached...

But the Radio is worse!! , 2m and 70cm has very bad 2e Harm. supression...

Volume at lowest is way to loud , receive a weak station produces a very loud noisy audio , horrible...and a lot of interference from the CellPhone!!

When i hear a station calling . and i reply to the call and go on Receive there is no Audio !!, i must go to another channel and go back , then i have Rx audio , very very strange , and w/o CTCSS its the same.....

Tx High or Low Power , i measure no differance , it's always High Power.

Vhf and Uhf Antenna's comes with SMA female conn's !!

Manual is horrible , it took me a day , to set te Language to English , the startup is in CHINESE!!

ProgramCable is not available , Software is , but only Chinese...

My advice , keep your hands of this thing....

1066. How do I get the UV-3R out of FM Mode?

Yahoo group: UV-3R (2011)
Date: 2011-08-05 01:48:28 UTC
From: w7cjd
Topic: 1066 Message: 1066

Okay, i had to try it.

Now, Iwant out.

I have all the local repeaters and simplex frequencies in local useage programmed. I used the software. Nevertheless, I do not want to have to do a complete reset.

How do I get out and stay out of FM Mode?

Connie/W7CJD

1068. Output filter Model

Yahoo group: UV-3R (2011)
Date: 2011-08-05 22:10:25 UTC
From: Reid
Topic: 1068 Message: 1068

I am trying to create a model of the output filtering network on the UV-3R. I'm doing this so I can try to figure out how to modify the circuit to further reduce the 2nd harmonic. I've put what I've done to this point in the files section located, here: <http://groups.yahoo.com/group/UV-3R/files/Output%20Filter%20Model/>

In the "Filter Model Schematic" Term1 represents the input into the filter circuit and Term2 represents the antenna. The section of the UV-3R circuit I used is shown in "Section of Schematic Used for model" and the results are shown in "Output Filter Response." Please take a look and tell me what you think and if I should adjust my model.

I also have a couple of questions about the schematic as well. First I am assuming D3,D6,D7 and D8 are used as limiters into the receive amplifier, is this assumption correct?

Second, I'm assuming the inductor dimensions given are wire thickness X coil length X number of turns, where the thickness and length are given in mm, is this assumption correct?

Finally I'm assuming the parts marked as "NA" and "NC" on the schematic are not populated on the board.

Any feedback is appreciated in this endeavor.

73,

Reid N0RC

More.......

Hello,Diodes D6,D8 are used as DC return path for D5 as well as limiters for RX input in VHF while D3,D7 do the same job for D4 in UHF.I'm not sure Term1 is 50 ohm,may be impedance has a lower value at that point.I think that there must be something else that causes a non linear response because 2nd armonic is much higher at low power levels.This kind of behaviour is not related with LPF response.
Regards.

I would rather guess that wire thickness X coil diameter X number of turns is more likely. 0.3mm X 7T = 2.1mm length. That gives around 40-50nH instead of 2.365nH for L1, and so on for the others.
73, Szabi.

Hi, just take a look at Wikipedia, where you can find two formula's for cylindrical air-core coils. Wire thickness does not play a role in the inductance, length, diameter and number of turns do.

Hi,

Got the programming cable. Installed the USB drivers.

Are using the UV-3R program found on 409shop.

Can read the memory content from the UV-3R, but then the program crashes.

Anybody has same experience and hopefully a solution?

Thanks !

Programmed my UV-3R via USB.

Priority was found to initiate scanning of VFO and defined priority channel.

But what does the Radio pulldown setting do?
It is a long list of 87M0....108M0

Anybody who knows?

Hello to all.

Please re-download schematic for AC adapter, because the previous version has small issues in component values.

The current version is 100% correct.

Sorry for the inconvenience.

1084. Scanning mode on my Baofeng UV-3R

Yahoo group: UV-3R (2011)
Date: 2011-08-07 20:24:25 UTC
From: roxfire
Topic: 1084 Message: 1084

I just got my new little Baofeng UV-3r. I have manually entered radio frequencies in the memory. My questions:
1. Is there a way to scan just my saved frequencies and not the whole band?
2. What does the CO..TO.. mean under the scanning menu
3. Is there a way to moved just between my saved frequencies instead of having to run through the whole band?

I have the programming disk and USB, but am unable to use in right now being the only plug that will work is my desktop that just took a crap(being a 9 prong female cable, it will not fit in my laptop which is a 15 prong female end).

Sounds like you want to get to memory mode instead of VFO mode. Hold
the U/V button down until a channel number appears or disappears. If
you just click it and not hold it long enough, it will switch between
UHF and VHF.

> I have the programming disk and USB, but am unable to use in right now being

A 15 prong plug is a VGA connector, not a serial connector. Most
contemporary laptops don't have serial ports and the ones that did had a
DE9 MALE on the computer end and expected the DE9 female on the cable as
it sounds like you have. USB to serial adapters have preserved the male
on the PC end of the RS-232 connection.

Hi Guys

The difference is that the UV-3R cannot be used with a remote mic (as the earth connection on the radios 3.5mm speaker/mic socket has a cap & resistor which reduces the speaker volume to an unacceptable level ~ the mic volume appears OK).

The UV-100 and 200 are identical models (as far as I can tell) but they can be used with a remote mic.

I suspect if you mod a UV-3R to have sufficient volume then that will upset the computer interface which also uses the mic socket

Egbert,

Thanks for answering a question I was wondering about but had not yet asked.

With only those two options, how do I turn Scan on or off for specific
frequencies. The booklet suggests that I can scan all frequencies, or
only those in a band. Is it possible to scan selected frequencies, some
of which are in VHF and others that are in UHF?

Not quite correct.

CO is Continuous operation, It will remain on the channel as long as the signal is present (with CTCSS/DCS if programmed)
TO is Timed operation. It will stay on the channel (with CTCSS or DCS if programmed) for a few seconds then resume scanning.

Hope that helps

Ah, better. So, show does one adjust the Time Delay before resuming scanning? Is that possible?

Rick, (and all you lurkers, too,)

Are you scanning all the frequencies that are set up in your radio or are these hame and PD/FD frequencies that you are scanning just a subset of all the frequencies set up in your radio?

I'm trying I'm trying to figure out how to limit the scan to a smaller selection than all 100 channels (once I get everything entered).

Specific channels can not scanned while others are not scanned.
In order to do that you need to upgrade to a Wouxun..... All channels programmed into the memory are scanned.

Also: I concur with the below info:

You can type in any port name you need. So, just type "COM9" in the port box and it will work fine.

1104. PC cannot talk to UV-3R.

Yahoo group: UV-3R (2011)
Date: 2011-08-09 20:21:18 UTC
From: Naqoyqatsi (aka the ICM)
Topic: 1104 Message: 1104

OK I've had my UV-3R for a few months now but have only just decided to start using a serial programmer.
No matter what I do the software (both Baofeng and CHIRP) cannot talk to the UV-3R.
The COM port is set in the software packages to that which my PC sets up for the USB/Serial adaptor (Com 4 in this case).

I am wondering therefore if the early version UV-3Rs cannot be programmed by a PC .

Mine has 18 options in the menu. It also does not set the TX/RX led to red when charging and to green when charged but has an icon on the LCD display.

Now maybe this is a dumb question but I assume that to program the radio you simply connect the usb/serial lead to it, turn the radio on and then boot the software.
Am I missing something somewhere like some radio setting to allow it to communicate with the PC?

Thanks Slim G4IPZ

Hi,
I think I have the same version as you (no charging light, just the on screen indicator). I start the software, turn on the radio, then plug in the radio. That sequence works for me. Plugging the radio in without it being on and then turning it on last doesn't let my computer see the radio.

Hope that helps.

1107. FM radio doesn't work

Yahoo group: UV-3R (2011)
Date: 2011-08-10 07:09:56 UTC
From: hb9tqj
Topic: 1107 Message: 1107

Hi all

Yesterday I got this nice little radio from Hong Kong. Works all very nicely concerning the Ham Radio part (which is of course the important thing).
But the FM radio does not work on mine. If I switch to it it remains silent. Once after leaving it some minutes on a broadcast frequency I heard a noise, one time even an FM station. But after turning the frequency dial it was silent again.
There is no signal on the VHF/UHF side I checked that.
Does anyone else have this issue? Any ideas? After using the search I seem to be the only one with this issue...

1108. Re: PC cannot talk to UV-3R. - CHECK 3.5MM PLUG DIMENSIONS!

Yahoo group: UV-3R (2011)
Date: 2011-08-10 09:55:39 UTC
From: Naqoyqatsi (aka the ICM)
Topic: 1104 Message: 1108

Further to my original post and with thanks to those who offered me suggestions I have now found the cause of the problem.

Although the 3.5mm plug on my lead was a good quality one, when I looked at it inserted into the radio, although it clicked home solidly, it seemed not to be in far enough.

When I compared it's physical dimensions to the plug on the headset microphone, the diameter of the base of the plug I was using was quite a bit larger and I suspected that it wasn't mating properly with all the contacts on the socket as it was being held proud of the socket by the radio's casing.

I took the plug off, put it in a pillar drill, got it spinning quite slowly and used a small hand file to gradually narrow the base of the plug to about two thirds of it's original diameter.
I then remade the lead and tested it on CHIRP and it worked immediately.

So if you've made up your own lead as described on this group and it doesn't work then check that the diameter of the plug you've used isn't too large.

As a another point I did try the baofeng software but that just crashes on my PC for some reason but now I have CHIRP running I'm happy enough.

I had exactly the same problem when I made up a cable for a VX-8R a while back so now I'm always alert for it.

As a matter of interest did you get a 3.5mm plug with the four connections with solder tags for the connections? The one I got the internal connections were like concentric tubes and it was very hard to solder to without melting the plastic insulation.

Hi Julian.

My plug was the same construction as yours with concentric rings.
I have used this type before and found that you have to run a small file across the ring to get through the plating before attempting to solder to them. A small amount of flux doesn't come amiss either especially if you're using lead free solder.

I also use my iron, which is a variable temperature at around 800F so that I'm in and out a bit sharpish before the plastic starts to suffer.
Mind you the plugs from Maplin don't seem to melt too quickly anyway.

Hi
If the unit is not faulty, then the only thing You can do, is to set the HAM radio to an unused (weird) frequency, turn on the Rx DCS, and set the squelch to maximum, eventually switch to narrow band. This ensures that no signal will disturb the FM radio.

73, Szabi.

I had a difficult time getting the programming software to connect with the radio until I discovered that either the cable or the 3.5mm radio connector or the cable are intermittent. By holding the connector under tension, the software will find and program the radio. The overall quality of these radios and accessories are somewhat poor. The 144MHz band 2nd harmonic was only about 22dB down from the carrier before modification. An interesting radio with a lot of rough edges.

Yes in my case it was, as I posted previously, due to the diameter of the 3.5mm plug base being too large to mate properly with the radio.
A bit of turning down with a file cured that.

As for the radios having tough edges -I consider my Baofeng is considerably better built than my Alinco DJ596.
On the UV-R3 I feel that the step sizes in the firmware for volume and squelch control are too coarse but other than that, considering how cheap they are you certainly get more than your money's worth.

The LPF issue is really the only problem that's unacceptable.
Other issues are not a problem for a $49 radio, or a $60 radio from some
of the US hams who are fixing the LPF and adding the programming cable.

As for qrz forums, see http://xkcd.com/386/

1126. Volume fix, best way

Yahoo group: UV-3R (2011)
Date: 2011-08-13 04:10:26 UTC
From: py2bbs
Topic: 1126 Message: 1126

Hello to all.

I analyzed all proposals and all modifications have a problem I do not like. Lower the volume of the VHF/UHF and also FM, but, that ends up being too low to FM.

The best solution is to change the resistor that mixes the audio from the RDA1846.

The original is 10K, a 22K or 33K resistor can leave the volume of the VHF/UHF and FM at the same level.

I got the best result with 33K.

The description of what resistor replace is here:

http://groups.yahoo.com/group/UV-3R/photos/album/2128049403/pic/1681529793/view

1127. No reception on VHF, a DIY fix?

Yahoo group: UV-3R (2011)
Date: 2011-08-13 10:43:52 UTC
From: Paolo Cravero
Topic: 1127 Message: 1127

Hello from a fresh UV-3R owner.
I have searched group archives and googled around but found no reference to a similar problem: my UV-3R does not receive on VHF. 88-108 is fine. UHF RX/TX is fine. VHF RX dead, but it does transmit (I can get through VHF repeaters, but I need to listen on another radio).

If I transmit on VHF in the same room with another transceiver the signal is picked up by the UV-3R, meaning that the VHF receiver is not totally dead, but very very very deaf. Unfortunately I have no signal generator to understand whether the in-the-room signal comes through the antenna circuitry or is picked up by the radio chip directly.

So, my fault seems to be into the VHF switching diode or the amplifier Q15 (according to the block diagram in the files section).

Has anyone experienced/heard of a similar problem?
To those who have opened it up: is it possible to look for cold solder joints and think of a DIY fix?

Since I bought it directly from 409 in Hong Kong returning the device is almost out of question, so I could keep a working UHF RTX and FM radio. Or try the fix anyway if experts here suggest that it is feasible.

Paolo IK1ZYW

PS: TX audio seems to be lower than FT817 and with background noise. But that's another story I haven't investigated yet.

Hi, Paul and welcome. To answer your questions you may want to review the "files" section of the site for the pin diagram of the plug (don't believe it's the same as your Yaesu. You can also download the programing software for review of your question. The sftware will not expand receive beyond the listed limits of the radio fwiw.

The Yaesu cable won't work. The Yaesu uses a single wire for both send and receive data. The UV-3R uses a separate wire for send and receive.
I bought this programming cable some time ago along with all the adaptor cables available. They now have a cable for the UV-3R which I also have bought and it works well.

So is Ed officially doing business as "Import Communications?"

I had connected the dots between Wouxun.us / KMA Antennas / Import Communications a while back:

http://www.brickolore.com/2011/06/baofeng-uv-3r-us-re-seller-import.html

I had not seen any sort of announcement from Ed about the new name and I just looked and the http://www.importcommunications.com/ site still isn't up yet.

Just curious...

(I bought my KG-UVD1P from him and was really pleased with the service he provided. He answered a bunch of questions on a Saturday morning, shipped it out that day, and I had it on Monday... so I think this is a good think for the UV-3R community if he is selling it.)

Gents,
let me reply to myself, for those that might experience a similar malfunction.

> reference to a similar problem: my UV-3R does not receive on VHF.
> 88-108 is fine. UHF RX/TX is fine. VHF RX dead, but it does transmit
> (I can get through VHF repeaters, but I need to listen on another
> radio).

The fault is still there. There might be few spots with a failure
according to the schematic diagram, but I will return the bare unit to
409 shop, as they required. I hope I will get back a 100% functional
UV-3R.

I have seen pictures on the group files section and identified the
area where the fault could be. Does anyone know if the components on
the speaker side of the board are for the VHF or UHF receiver? Is
there a parts placement diagram somewhere to be seen?

I have also measured the power output with an instrument I am unsure
about the calibration (45-1000 MHz spectrum analyzer) because I get 4W
out both on VHF and UHF and 2W @UHF low power setting.

Nice little radio but lacking quality control on the production line IMVHO.

73,
Paolo IK1ZYW

1149. How do you use Chirp to write to different radios?

Yahoo group: UV-3R (2011)
Date: 2011-08-17 16:25:33 UTC
From: Michael Dodds
Topic: 1149 Message: 1149

Hi all,
I have a UV-3R as well as a Wouxun rig and I want to set up the frequency list in the UV-3R and then write it to the Wouxun. The latest daily build of Chirp will read and write to both radios just fine, but I can't figure out how to write the UV-3R .chirp file to the Wouxun. When I try to write it, the dialog box where you select the radio brand and model has the Baofeng in it and the options are grayed out. Anyone know how to do this?

Thanks,
Mike

For most types of radios (including your two), CHIRP downloads an
"image" of the radio. This image is extremely radio-specific and can
only be uploaded to another radio of the same (exact) model.

What chirp *can* do is import from one memory format to another. So, in
your example, you should do the following:

1. Download your UV-3R, save it to myuv3r.img
2. Download your Wouxun, save it to mywouxun.img
3. With the wouxun image open, go to File->Import and choose the
myuv3r.img image file
4. An import dialog will come up that lets you choose which of the
memories from the file you want to import into your wouxun. Select
appropriately and then click "import".
5. When done, you should see the memories in the display. You can save
(or save-as) if you wish to preserve this new image
6. Finally, upload the changed image back to the Wouxun

Some people like to keep their frequency list in a completely neutral
format. To do this, either go to File->New and create a new CSV-type
image, or export one of your existing radios to CSV to get started. You
can open the CSV file just like an image, make your changes, etc. Then,
you can import from that neutral CSV file to any of your other images to
freshen the radio's memory.

Make sense?

Right from the horse's mouth :) Thanks Dan! I knew I was missing a step somewhere. I was trying to write the exported .chirp file rather than importing it into the Wouxun image.

Any plans to support the Yaesu FT60-R?

Mike

A quick look at the Chirp software makes me wonder if it can be used to set up/transfer AMSAT freq and channels. I only see one frequency listed by channel and then an ofset option....most offsets in radios are limited to say 60mhz+/-. In sat work we receive in UHF and Tx in vhf. Anyone know?

Some of the radios support a split duplex mode, where they have space in the channel to store a full transmit frequency instead of just an offset. Chirp supports this for some of those (some Yaesu and Kenwood models). Many radios (most Icoms) store only an offset and it's not large enough to get from VHF to UHF.

If you have a radio that's supported by chirp, supports split mode, and chirp doesn't let you do it, let me know and we can get it fixed.

I'm afraid that is not possible. However the radio IC does support the 200-260MHz range, it would need a firmware modification, and also a new frontend.

Date: 2011-08-18 15:46:24 UTC
From: andyfoad@rocketmail.com
Topic: 1160 Message: 1160

I have two UV3R's.

Old style, limited menu's and no s-meter.
I also have the updated version with 18 menu's.

I found that the 18 menu version when programmed using the
manufacturers software would corrupt the frequency steps and
other information.

The result was non working memory channels and the display would
have corrupt characters on it.

The cure ?

Simply turn down the com port baud rate !

1200bd seems to work fine every time now.

Support for split duplex on the wouxun is in the tree and will be in
tomorrow's build.

Can the UV-3R do it? I can't decipher how from the manual. I have to
give the UV-3R back tomorrow, so if you know how and want it, please
speak up ASAP so I can get it added quickly :)

Um, what? I meant "how do you set the independent tx frequency on the front panel of the radio?"

However, I just used the windows software to do it and I'm looking at the bits now.

I had a look at this when I was trying to create my own software
(aborted as Dan has done a much better job with CHIRP). The last bytes
of the memory record contain the TX frequency but they aren't used. The
offset value is always used instead. In the case of split band operation
the offset is simply very large, e.g RX 147.500 TX 439.300 Offset +291.800.

Cheers,

Tracy VK3FTSR

The TX frequency _is_ used (well set) by the software on simplex
channels, but I have no idea why. The offset field is just as large as
the other two fields, so it can handle the large value.

It's just too weird to have been designed that way from scratch :D

Ignore this if others have already answered, Tony.

Assume the channel database file you want to open is xx.dat. Use your instance of Chirp to open xx.dat, then, export and save the channel database as a xx.CSV. Open that file however you like to open .CSV files, my preference is MS Excel however you should be able to use Wordpad or any other editing program. MS Word should work although it wouldn't be my choice.

Cannot be done. And even though the newer radio *chip* supports 220
MHz too, the radio CPU and filters do not.

Greetings,
Paolo

Anthony,

I assume you have the UV-3R USB data cable with its driver installed-
'USB Driver for XP.exe'

and Programming software installed using
'UV-3R Programming Software.exe'

Start the programming software and confirm that with the cable connected to the handheld that you can use 'Device Read' to download the radio memory contents.
You may have to try several com ports until you find the one that works.

Now, using 'File Open' load a .dat file into the program.

Having make any required ammendments use 'Device Write' to send these settings into the handheld overwriting previous memory contents.

If you have made any changes save your revised configuration 'File Save as' using a different name before exiting the program.

Hope this is of help and apologies if I am guilty of 'teaching you how to suck eggs'.

From: ik0zrr_facebook
Topic: 1179 Message: 1179

Hello everyone, I understand the software for uv-3r e2-map, it reads the locations and reports.
A given change in the program and go and re-read map of e2 clear where data is entered.
Reading the manual I understood that confidential to the radio 'power law and besides the data you put in mode' x-rays, I identified the memories, high-and low-power, shift etc but no where to change location for the value there to receive 76-108 or enable the 220 MHz (if we can do). software that reads the eeprom??? writes the eeprom without desoldering?
best ik0zrr
sorry for my bad english

Hi Bob.

Thanks for the assistance, I'm always open to advice, especially as I'm new to this and you guys know what you're talking about. No point in making things difficult for myself if there's already the knowledge and experience out there.

Kind regards, Anthony.

Is it possible to decouple the resistor at audio with some
capacitance in parallel, increasing the audio but possibly
leaving the resistor to do it's job on the comms interface ?

1187. CHIRP - New feature request

Yahoo group: UV-3R (2011)
Date: 2011-08-20 01:22:04 UTC
From: yrlesdude
Topic: 1187 Message: 1187

Hi Dan,

I was wondering whether CHIRP could support a 'notes' field for each memory entry where one could enter up to 40 or so characters in the text field.

I was also wondering whether there was any interest in supporting memory slots for FM broadcast in the UV-3R.

Keep up the great work with CHIRP.

Yes, I plan to add this to the CSV driver so that you can keep generic frequency lists in CSV format (with notes) and then import it into your radios (which don't support comments, of course).

> I was also wondering whether there was any interest in supporting
> memory slots for FM broadcast in the UV-3R.

I do not believe that the FM channels are stored in the memory that is accessible over the serial port. I've spent some time looking and I think it's stored elsewhere in the radio.

Hi Ron,
My UV-3R is on the way, so unable to test it.
I've tried to open some .dat files downloaded from the Files Section, but unable to open with Chirp as you described.
Chirp only supports img, chirp, csv, icf and vx7 formats. If I force to open a .dat file, I get an Unknown file format error message.
Import doesn't help either.
Is there any other way to open it?
Thanks, 73 Szabi.

You can use the UV-3R software to open .dat files, read the information and edit then send the data to your transceiver. Would be nice if CHIRP supported .dat files though!

Date: 2011-08-20 16:21:11 UTC
From: wagner stabolito
Topic: 1187 Message: 1198

My Baofeng UV-3r, has 15 positions to record FM frequencies and
99 positions to record the amateur radio frequencies.
The 15 positions from FM do not affect broadcasting amateur 99positions.
The amateur radio can be recorded in any sequence, whether they are UHF or VHF. example:
position 1 VHF
position 2 VHF
3 position UHF
position 4 VHF
UHF 5 position
6 position UHF
and so on.

When you record an FM frequency, it will save in positions 1 to 15 and will not affect the positions 1 to 15 with amateur radio frequencies.
The recording process is the same. Selects the frequency, press Function, them Menu, and the number of memory location flashes in the display.
Select in Dial the desired position and press Menu again to save.
When you reach the position indicator 15 back to position 1, ie, just FM 15 positions are likely to be recorded.

I hope this helps.

Topic: 1187 Message: 1202

Drummond, et al,

Okay, that's page 29 in my manual and, yes, I see instructions for
saving up to 15 FM frequencies.

Thanks and 73 de KK4DBR, Ron

1203. Re: GOOD DUAL BAND ANTENNA TO USE ON BAOFENG UV-3R

Yahoo group: UV-3R (2011)
Date: 2011-08-20 19:02:56 UTC
From: g4ilo
Topic: 1142 Message: 1203

That's curious, because I just tried it and I got a flat infinite SWR from 125 - 165MHz on my antenna analyzer whereas the 666 dips to a 1.2:1 round about 147MHz. A 7 3/8" piece of wire would be a quarter wave somewhere below 70cm so I suppose it would work reasonably at UHF.

From: Steve
Topic: 1204 Message: 1204

FWIW I just picked up a multiband antenna from http://www.k1cra.com/catalog/product.aspx?productID=958(Workman SMA144-440). Good results on both 2meters and 440. Very flexible and 7.5" long. Bought it for $10.95 with free shipping in US.

From: g3ypq
Topic: 1206 Message: 1206

Not all SMA antennas will fit the UV3R as the LED gets in the way.
I've just uploaded 3 pics to the group as 'Telescopic Aerial'. For the benefit of newcomers I declare an interest as I supply these, but they work well. Being telescopic you can set the 1/4 wave length correctly on say, the marine band. Fully collapsed its a 1/4 wave on 70cms. Fully open its a 1/4 wave on 2m and 3/4 wave on 70cms, and works better on the broadcast band. Just remember to use it fully open on 2m TX.
On Ebay its item number is 270800902482 £14 free postage.

I concur with Julian, the Nagoya 666 works very well, on par with my Comet SMA-24 HT which is twice the length. Overall, a huge improvement over the Baofeng stock antennas while keeping a manageable form factor. The only not-so-great about the Nagoya is the build quality. I can do anything to the Comet with no consequences while, after one week, the 666 is already bent at the bottom where the antenna rod leaves the base. But then, it was 1/3 of the price, so, if you are a bit careful you will enjoy it for a long time.

It's a good antenna. I use one on my Kenwood TH-D72 and it is better than the stock one from Kenwood. But it looks a bit bulky on the UV-3R.

The Nagoya to avoid is the 401. It's very small and looks a perfect choice for the little radio but the VHF resonant frequency is quite a way off the 2m band which costs it a couple of dB in performance compared to the 666.

Same as the Yaesu VX-3R. Data in and data out are on the same wire for
VX-2R and 3R (and probably VX-6,7 and 8).
The UV-3R requires separate data lines so no adaptor will work.
You can adapt most programmers for Chinese radios that use the Kenwood
style of wiring (Wouxun, Puxing etc)

The TJ2A handheld kit looks neat. I watched a series of youtube videos on those a little while back. $169 isn't too terrible of a price either, I don't think. The FG-01 antenna analyser is cute too. They don't say how much that costs though.

Here's a 20M ssb "shirtpocket" transceiver that was in a QRP magazine this year: http://www.jessystems.com/20MSHIRTPOCKET.html
I don't know if there's a kit or not. I think you have to source your parts and make your own boards if you want to make one of those.

Ah, I've been hearing it ever since the two frequencies were first posted here. Are those signals decodable in any manner or is it just something that's neat to hear?

From: Ken , VK7KRJ
Topic: 1206 Message: 1230

Hi, anyone have any dealings with this dealer about returning a faulty radio?
I bought a uv-3r from him, faulty out of the box and he has not replied to my email requesting an address to return the thing to. Not a good way to get positive feedback from customers on ebay.

Sorry to hear of your experience. I've purchased numerous items from this vendor however have never had the reason to return an item. Generally you can expect to bear the cost of shipping back to him but from feedback it appears he will be responsive......sometimes, after several follow ups, the hint of negative feedback brings results.

Also would be wise to report any out of the box malfunctioning units to the manufacturer. (http://www.verotelecom.com)
Even considering the low price, the lack of qulity control is inadmissible.

1244. ttl2USB Converter

Yahoo group: UV-3R (2011)
Date: 2011-08-24 14:23:27 UTC
From: W3FIS
Topic: 1244 Message: 1244

I have a ttl2USB converter for my FT-60R. The FT-60R uses a common line for transmit and receive to the radio. The UV-3R uses separate lines, by my understanding. Obviously, I'll have to fabricate a different patch cable for the UV-3R, and likely remove the internal jumber in the ttl2USB device.

Has anybody used this interface with the UV-3R? Mine is being shipped from Wouxun.US today.

How about installing the new version over the older one? I suppose you could delete your existing chirp software and the folder it's in before you install the new version. I peeked in the registry using RegEdit and did not see any keys for chirp in the software section. This may explain why you don't see it in Programs and Features (in Control Panel).

You don't need to un-install before installing a newer version.
I check with the daily update page and simply download the newest version and install it over the top of the previous one.
I have had no problems.

As for un-installing CHIRP, as it doesn't appear on the windows "add/remove programs" tab in XP control panel I assume it doesn't write to the registry. So if you want to remove it simply delete the CHIRP folder which is probably "C:\Program Files\CHIRP" unless you opted for a different installation location.

1258. Inexpensive belt clip

Yahoo group: UV-3R (2011)
Date: 2011-08-26 01:45:43 UTC
From: Steve
Topic: 1258 Message: 1258

FWIW, the existing belt clip on the UV-3R might be termed flimsy at best and prone to breaking. I happened on an alternative that has worked well for me for those wanting to clip to belt vs tucking it in your shirt pocket. Our local dollar store (Dollar Tree to be specific)carries the clip and two "male" attachments one of shich has a small metal clip and the other a peel off adhesive stick on mount. In other applications I found the "stick on" not to stick on very long.

I took the one with the small metal clip and popped off the clip and pulled out the small metal sleeve. I found the existing phillips screw was actually long enough to then attach the receiving attachment to the back of the radio. The receiver portion of the attachment is plenty thick enough for anyone who might want to reduce the thickness to be sure the screw catches a few more threads.

Not bad for a buck. I've uploaded a photo of the finished product.

Thanks Slim and Ron !

So it is that simple.

B.t.w. I happened to see that in Jv16 Powertools (2010), CHIRP is visible with an un-installer.

> As for un-installing CHIRP, as it doesn't appear on the windows "add/remove programs" tab in XP control panel I assume it doesn't write to the registry. So if you want to remove it simply delete the CHIRP folder which is probably "C:\Program Files\CHIRP" unless you opted for a different installation location.

@Mark,

As a fellow HAM you should recognise 'F4AWH' as a french call sign, therefore you could have made use of any online translator to interpret the original question of Jean-Luc . . . ;)

But I agree to use English as the 'native' language in this yahoo-group.

I can offer Jean Luc my help:

Jean Luc, s'il est encore nécessaire vous pouvez me contacter par email, pour expliquer votre question.

I saw where there are a few different Ebay sellers that are offering the Baofeng UV-100 and UV-200. What's the difference bewteen the three? Has the UV-100 and UV-200 fixed the volume problems of the UV-3R?

Dag Willem, aangezien de voertaal Engels is in de groep zou de Franse amateur de vertaler naar Engels moeten gebruiken en niet wij naar Frans.

Since the native language here is English my opinoin is that the french ham should have used the translator not the other way arround.

Mark

Curious, why would anyone want to buy a speaker mic for a radio where the entire unit is smaller and lighter than most pro speaker mics?

Perhaps I'm missing something but wouldn't it be better to just clip the entire radio on to the shoulder and use it as if it were a speaker mic?

Just a thought.

For me, I've often feel that with strong signals, the volume is too loud even at the lowest setting. I was thinking earlier today that I might consider a small external speaker with its own volume control. My idea was something small enough to rubber band onto the case.

1272. Single antenna vs. Icom antenna

Yahoo group: UV-3R (2011)
Date: 2011-08-28 04:45:24 UTC
From: Bill
Topic: 1272 Message: 1272

I was getting nothing but white noise while attempting reception on commercial FM broadcast. I was also experiencing choppy reception from a powerful repeater. I decided to try the 2m/70cm antenna from my old T90-A Icom HT. Wow!! What a difference. FM broadcast and the big repeater were what I expected. The new dual-band UV-3R antenna seems poor to me. I could not open the repeater with the OEM antenna while running 2-watts. I have opened the repeater from the same location with 200 mw and a short antenna on a RS HT. Anyone else have this experience?

This has been discussed numerous times.

The 2 inch stubby antennas that are supplied as an
option simply don't work. The original mono band antennas do work.

Most users requiring a good performance dual band antenna
have opted for the Nagoya 701 or 666, available for about $12
delivered.

I prefer the Nagoya 701's. In fact I have purchased 5 of them
as they outperform everything else I've ever tested.

Hi guys! I'm new to this list so treat me gently :) I've just purchased a UV3R, it came from HK and took one week (the normal time) to get to the UK here. I did a few tests with the 2m rubber duck and found it to be 2 s-points down on my Watson HSMA270 dual band whip. So I now use that and have no need to swap aerials :)

The Watson is a quarter wave on 2m and 5/8 on 70cms.

Just thought this might be useful for anyone in the UK who wants to get the best on both tx and rx.

Is this comparing the Watson to the UV-3R single band 2 metre antenna? I have no idea what the Watson antenna is but assume it is considerably longer as it's a 1/4 wave on 2 metres. This would make it about 500mm long. Is this correct? If so, then I would hope it is a lot better than the supplied single band antenna. I'm just curious. I am more than happy with the performance of the supplied single band antennas when you consider their size. It would be an exceptional dual band antenna of the same size as the single band 2 metre antenna that could match the performance.

Grant, ZL2BK.

Tim,

What about commercial FM broadcast stations? I could not receive any in my metro area of powerful FM stations without changing the antenna. I would like to know your experience with 2 meters. I have not tried 70cm, and maybe that is where the antenna is optimized.

Hi Grant. Yes I'm comparing the Watson to the UV3R 2m single band ae.. It's 400mm long, and available in the UK at this page, although they've misnamed it as a rubber duck ae. Look for WHSM270:

http://www.wsplc.com/acatalog/Watson_Handheld_Antennas.html

Mounted on the UV3R it doesn't look too long for the size of the rig. Out and about I have the rig on my belt and the ae. going up underneath my shirt/t-shirt, as I always did with my Yaesu VX150 which I originally bought it for. But the UV3R is so much smaller as we all know! :)

David G4TUP.

Greetings

I'm about to purchase a UV-3R this afternoon. I've been reading the reviews. On the most part they are favourable. I see comments have been made regarding the antenna. I'm wondering if a HT dual band antenna available here North America preferably in Canada.

Hi Don.

I've recently taken possession of a pair of UV-3R's and so far, very satisfied. The only pain is having to switch antenna's. The received wisdom on here is that the Nagoya NA-701 represents good value for money in the dual band antenna market. They are readily available on ebay at a good price as they invariably come from Hong Kong. I've ordered 2 today!

73's, Anthony.

Hi Steve,

I bought a cheap speaker mike from 409shop, just so I could use its built in 3mm headphone jack. It seems to work OK for me and, yes, it is about the same size as the UV-3R. It also lets me leave the radio on the table, connected via an SMA to BNC adapter to my Diamond X50, which is definitely better than the standard antenna.

Cheers,

Tracy VK3FTSR

From: wa1kli
Topic: 1295 Message: 1295

Just got my UV-3R today from Hong Kong, well worth the wait.

I could use some help on how to tune it to a frequency that is not a multiple of the step size, specifically 144.390 MHz (the national APRS freq).

Thanks.

From: Anthony Massey
Topic: 1295 Message: 1297

Hi.

If you press the U/V button until VHF appears in the display, the press the function key once (this allows you to tune in 1mhz steps) and turn the tuning knob until until you reach 144 mhz. Then press the MENU button and turn the knob until you come to STEP on the menu. Press the U/V button once again (the step size will appear in the display). Turn the knob until you reach the desired step size (in this case 10khz should do). Press the PTT button briefly (this sets the step size to 10khz) then turn the knob until you reach 144.390. Press the PTT, you should now be transmitting on that frequency.
Alternatively, if you have the programming lead and software, programme the memory channels with the PC. So much easier.
Hope this helps. Anthony.

Yes, it is very easy to tune, but you have to use the correct stepping on the UV-3R. Select step to 5khz and tune to needed frequency.
If you want a quick tune, press the middle button on the left and rotate the knob to 144.xxx MHZ, then press again the middle button on the left button and by rotating the knob you'll find the .390khz frequency. be aware to have the step setting set to 5khz from MENU.

To my knowledge the low power is one watt, I doubt that your power meter would show an accurate reading at such low powers, mine doesn't even set to the lowest (20W) range, any thing less than 5W is inaccurate. I have set my UV3R on to powersave that way it automaticaly reduces tx power if it receives a strong signal the same as my VX7

Gil,

When the radio resets, it is only in VFO mode.

Briefly pressing the <U/V> button should toggle the VFO between VHF
and UHF ranges.

Once memory channnels are stored, a "press and hold" of 1+ second (I
think) should toggle between VFO and memory.

Let me know if this works, Mike n2mho in SNJ

Well, my UV-3R specimen has 18 menus but only two step sizes. Actually in Europe allowed steps on V&UHF are integer multiples of 12.5 kHz (see "VHF Managers Handbook " on IARU Region 1 www.iaru-r1.org) . Additionally my UV-3R does not receive on VHF, but I wouldn't call it a "feature"...

My item's serial number is 3110425xxx FWIW, bought in early July 2011.

So, there _might_ be different RTXes being dispatched depending on the destination, being the charger AC plug different for few countries (UK and continental Europe, to mention two close examples). Also mine had the "CE" mark on the box.

From: Don Poaps
Topic: 1307 Message: 1317

What ever was given to me by the supplier. A UBS with a female plug plus two male plugs. So I'm getting is that the plugs don't make a connection. So does that mean one files down the plastic part of the plug so it will seat further into female plug on radio and USB plug.

Hi Don.

Are you sure you have the correct programming cable? I've had absolutely no issues with programming the unit with the supplied accessories.

I think I have the same issue as others are having. I insert the plug and the light turns red.
The program/software can't connect to radio. Even though, the PC device manager > Port> Com is set for 2 and the software set for 2.
Unless I'm missing a step.

Don't push the plug in too hard, if the red TX light comes on you need to
back it out a tiny bit.

1319. Re: Low power / High Power

Yahoo group: UV-3R (2011)
Date: 2011-08-30 17:11:40 UTC
From: Dave
Topic: 1300 Message: 1319

Thanks Bob did some further tests tonight.

I checked my cheap meter (5w scale) with the FT817, and sure enough I could see 0.5w, 1w, 2.5 and 5w with reasonable accuracy.

I checked my UV-3R
433 MHz
high power = 2.5w
low power 2w.

145 MHz
high power = 2w
low power = 0.5w

May of course be my unit, or a sw glitch but the low power setting would appear not to work on UHF ?

All the power units quoted are into a 50 Ohm load, and of course subject to my meter accuracy. Its not the absolute values that interest me, but the relative difference between high and low power.

Anyone else care to try (just for academic interest)

It makes little difference to me, but I would like to prolong the battery and PA life so having low power on UHF would be good...

Thanks for the help Bob, interesting.

Dave
M0TAZ

PS on the power save feature, I have no idea if it actually works. I guess the sceptic in me says based on my UHF tests probably not :-)

Hi Dave
I haven't actualy done any testing but I have five radios here, one for each of us, I will endeaver to test each one some time this week and will let you know the results. I will say that mine was used over the weekend with about a 20-80% duty cycle and the battery still indicates 3.7V at switch on. The radio does seem to be most economical with battery power.probably due to being a Software Defined Radio, less circuitry to draw power.

Thanks Julian the VHF results are very similar to mine...

Sorry school boy error on the UHF, the meter I have isn't rated at 433 MHz, so it wasn't able to get an accurate reading on that band.

Appreciate the updated results, in hindsight I think that is representative of my radio...

Thanks
Dave M0TAZ

I would suggest the results you have provide a good

Greetings

I must have a dud. I tried the male plug both ways. Making sure that transmit light was not on. I still can not connect to radio.

Back to the drawing board. I was able to get ser2pl.sys from off the web. I know the USB cable part works.

Later

At 145 MHz I have 2.3W and 0.2W
At 430 MHz I have 1.8W and 1.2W

Those readings should be accurate within 10%

Don.
Please check my post 1108.

I had exactly your problem.

The fault was due to the width of the bottom of some 3.5mm multipole plugs being too wide to actually go far enough into the radio body.
In my post I explain what I did to deal with this.

1329. Stuck in FM Mode

Yahoo group: UV-3R (2011)
Date: 2011-08-30 20:28:21 UTC
From: johnoshea1
Topic: 1329 Message: 1329

Purchased my unit over a week ago. Ran into Stuck in FM Mode problem and sent the following email to party I purchased unit from on Ebay. So far he has not returned with a solution from his supplier. Maybe someone in the group has a solution!
Sent to Radiogearpro:
Have had unit for week and operates without any problem EXCEPT ONE
It is stuck in FM mode. It plays on the FM station but when I press the U/V button nothing happens, It will not switch out of FM to UHF or VHF I read through the manual. It only tells you how to turn on the FM but not how to switch it off. I did find after playing with the buttons that when FM was on that if I push the U/V button followed by the Push to Talk button that the unit switched to UHF. But when I pressed the orange OFF button it shut unit off. However when I pushed same button to turn it ON it came on in FM mode!
Bottom line is. How do I turn off the FM mode and keep it off?
Hope you have an answer! Thanks for help. John O'Shea (Quietstar)

Topic: 1322 Message: 1335

Well, I just got my UV-3R today. Programmed it up for a couple of my local repeaters. Considered the antenna issue. I have a Diamond SRH77CA that I had gotten some time ago for my VX=170 and VX-177 Yaesu's. A perfect fit on the Beofeng.

However, the radio is dwarfed by the antenna! With the stock dual band antenna, I can hit 2 repeaters within 10 miles. The one 20 miles away -- no dice. The SMA on the Baofeng is the SAME as the Yaesu, versus the "reversed" on my Wouxun HTs. However the Diamond, being larger and heavier, might put more strain on the SMA connector, so I think I need to be careful there.

I have no clue, maybe because English is not my native tongue but the explanation in the manual does not make sense to me.

Anyone who can explain it ?

We know it is a typo, but what exactly does RelayM do. The manual is as clear as mud on this one. Does anyone know?

1339. RDA Micro now offering to ship samples on RDA 1846

Yahoo group: UV-3R (2011)
Date: 2011-08-30 23:40:17 UTC
From: John Hogenmiller
Topic: 1339 Message: 1339

As some of you know, the key chip in the UV-3R is the RDA 1846. What's really interesting about this chip is how self-contained it is. You can essentially have a fully working radio with only a few supporting components and an external device to set the frequency via the GPIO pins. Also - this chip is capable of 220Mhz operation (even though the UV-3R doesn't support that in its firmware). The data

I've been looking at how to order some of these chips for some projects (completely PC or Arduino controlled tri-band radio perhaps) and figured I would have to call some of the distributors in Shanghai and hope that they have an English speaking sales rep.

RDA has been modifying their website throughout the week and today they added a sample application link. I thought this would be showcasing how others have used the chip. To my delight, it turned out to be a form to order samples of their products, including the 1846.

A few warnings. Only request a sample if you are seriously going to do something with it. If they get flooded with frivolous sample requests, they may shut down the program. Also, I am hoping that someone familiar with ordering wholesale from China can take the opportunity to order some of these chips for resale.

Product page: http://www.rdamicro.com/english/Product_view.asp?id=130

The sample order page: http://www.rdamicro.com/english/online.asp

Finally, this is a QFN-32 5mm x 5mm IC package. This site offers breakout board for it, taking you from a tiny square chip to a DIN package (suitable for breadboard insertion) http://www.epboard.com/eproducts/protoadapter2.htm#QFNtoDIPAdapter The adapter is just under $19,and for an additional $12 they'll solder the chip on for you. So for about $35, you could have this 5mm, 32-pin chip placed into a package that you can put on a breadboard.

Granted, anything you prototype is going to be more expensive than the mass-produced, $50 UV-3R. Just by getting this thing breadboard compatible, you're adding $20-$35 to the cost of the chip, which is over half the cost of the finished radio. But ultimately, if the chip itself can come cheap, it could lead to some interesting products.

The memory mode took me a while to figure out as well. Hold down the U/V key for 1-3 seconds. A small two-digit number will appear at the top of the lcd (and the frequency may change). You can then use the top knob to switch between memory channels.

Bob,

> I have set my UV3R on to powersave that way it automaticaly reduces tx power if it receives a strong signal the same as my VX7

I have read the VX-7 manual and it mentions both a RX SAVE function AND a TX SAVE function, as two separate settings. The former turns on the receiver for small amounts of time to check if there is a signal. The latter does what you have described.

On the UV-3R manual there is no indication that they implemented a TX SAVE function, and actual current drain measurements have shown that it actually works as a RX SAVE mode. I have noticed myself the RX save behavior too.

73,
Paolo IK1ZYW

PS: FWIW, mine measured 4.4/3.7W on UHF and 4.5/0.2W on VHF. It was done on a spectrum analyzer using both its IF bandwidths, with the same result. These figures don't make sense (double than expected), so I am waiting for a chance to compare the reading with a more quality controlled FT-817.

This IS written on the manual. But but but... I didn't notice this until I read the English version of both VX-7 and UV-3R manuals: the UV-3R is a copy and paste of VX-7R's manual. Like homozygous twins (for this SAVE function).

Perhaps the UV-3R manual writer wanted to copy the chapter about "RX Batter Saver Setup" at the bottom of the previous page, on the Yaesu manual?!?!

> and actual current drain measurements have shown that
> it actually works as a RX SAVE mode. I have noticed myself the RX save
> behavior too.

This RX current optimization was measured.

Has someone been able to measure the TX power SAVE function in action?

I too have noticed the UV-3R doesn't seem to filter out some signals very well. However, its DSP, it seems to learn 'static' over a few transmissions and then does full quieting. Next time you encounter the weak signals, try just letting the radio do its thing and see if the noise "stops" on its own.

To turn squelch off entirely, hold down the monitor button.

Hi Szabi.

I hadn't tried that but just did and have to agree with your findings.
Using the GB3NS repeater there was no difference between squelch setting 1 and squelch setting 9 as regards the rig opening on the weak receive signal I get from that repeater.

Ah well..

Greetings

With a little help from one of the members of the group. I can now see the channel number on LCD.
I copied my *.dat file to HT. I have a UHF and a VHF. I copied both to the HT. Only the last set of info shows in memory.
I have a feeling that if I want both VHF and UHF is to program both in the same file. That I will find out later when I get time to input the Ham repeater and other Freq I like to have on HT.

I want to thank all who have help me figure this little radio.

I've had good luck with a dual band antenna from a Yaesu VX-3. You can order them directly from Yaesu parts dept. in Cypress, Ca.

Joel

What was the model number of the Yaesu external mic?

I think we're all looking for a positive indication of one that works!

Actually it's an MFJ-295 and after a thorough check transmit audio is extremely distorted. Receive audio is good and it does key up. My apologies.

You mean you really expect someone to be able to reprogram the firmware in the radio itself to drive the internal display differently than provided by the manufacturer? I'd LOVE to have that capability on my D700, but I've never seen it on any radio. That's an entirely different level of programming that 99% of the programmers out there have ever encountered.

Lynn (D) - KJ4ERJ - Author of APRSISCE for Windows Mobile and Win32

PS. Firmware for the Tracker2 family TNCs are open source, but that's the closest I've seen to what I think you're requesting. And there's a pretty big gap between programming a TNC and programming a radio.

Greetings

After having a chance to play and scratch my head a few times. I think I've figure out the HT. I'm now able to program and did see the function in the software program V-UHF. I was doing VHF or UHF to program radio. No wonder only VHF or UHF showed. Not both.
Also no wonder I couldn't get it programmed. I had the plugs reversed. The 3 ring plug goes into the radio. Not into the female plug in the USB cable.
I've also notice that my SMA connector from my small mini dual band antenna has a problem with it. When I screw it on. Radio won't transmit, when it's looses off from thread. Radio works. I think I have some sort of short in the connector.
I'm going to bring it to the club tonight to see if the meters readers can give me an answer.
Other than loosing the rubberised cover for power and program ports. The radio seem to perform quite well. The covers came off when some how battery cover was seen on the car seat. Rubber missing will need to check car.

It wouldn't be easy by any means, but not entirely impossible. There's a number of groups that try to pry into a devices internals and write custom firmware. For example, one person converted a $16 "IM ME" toy into a spectrum analyser. http://ossmann.blogspot.com/2010/03/16-pocket-spectrum-analyzer.html That device is interesting once you get into it. It uses chip that can tx/rx on 281 - 361, 378 - 481, and 749 - 962 MHz.

The UV-3R is actually a SDR (software-defined radio). The main chip is an RDA 1846 and is amazing. It is a little 5mm x 5mm package that you can hook power, microphone, speaker, and antenna to it and you have a basic radio. A bit of software sends signals telling the 1846 what frequency to tx/rx on and any PL tones. I have actually requested a sample of these chips from RDA and I am going to try to make a PC controlled SDR from it. BTW - the chip itself is tri-band: 2m, 1.25m, and 70cm. So the UV-3R is physically capable (but software limited) of being a triband radio.

On the UV-3R, this software is placed into a MC81F8816Q (http://www.abov.co.kr/data/manual/MC81F8816.pdf). With the right hardware, someone could pull the code out of it and take a peak. They could also put their own code into it. Granted, the code you pull out is going to be machine code, whereas most programmers will do their coding in a higher level and have it converted. So it's theoretically possible to write your own code for this microcontroller and flash it.

The tricky part is getting a connection to the chip. If we are really, really lucky, the programming cable we use to write the memory can be used to update the flash firmware as well. However, from some other posts, Baofeng has commented that no firmware updates would be made available for this radio. The other method is to find the relevant pins and make a connector (involves surface mount soldering) similar to how some router hackers will add a JTAG connector. Take a look at pages 139 and 141 in the PDF I linked.

That being said, it's probably not going to happen. More likely, another version of this radio or a kit radio based on this chip will come out. Perhaps one of the SDR projects will pick up the chip as part of an open source project. I know I hope to make a radio out of the 1846 chip, but I won't be experimenting with the UV-3R itself. My vision is a little grey box with a usb hub, a usb sound card, and a usb "serial port" inside it, alongside the 1846 chip. I would add an antenna connection and some audio (mic/headphones) connections. Then you would have this completely computer controlled radio with tri-band capabilities.

I've checked this option with our local repeater DB0QL and for me it
seems, when activated, this option suppresses the Roger Beep of the
repeater.
There is an audible pause in RX when releasing the PTT while the
repeater sends its beep.

There have been reports of some giving low deviation and there is a mod for it, search google. It involves changing a resistor and apparently after the mod the audio is quite punchy.

I haven't used my UV-3R very much yet, but on both occasions I was complimented on the tonal qualities of the modulation, but was also criticized for how quiet I was. You might want to ask for clarification on the "nice modulation" comment.

The quietness of the UV-3R is especially noticeable when in a multi-party QSO where you're the quietest one in the bunch and the receiver(s) can't turn up the volume without getting blasted by the other parties. I've wondered if that's why the UV-3R's receive audio is so blasted loud? Two UV-3Rs seem to be made for talking to each other, transmit soft and amplify on receive...

Quiet outbound audio combined with really loud inbound audio suggests a
modulation width mismatch between you and the other parties... Are you
sending/receiving in narrow mode? As far as my experience goes, i can
work both, narrow and "wide" repeaters in this area just fine with
similar volume as my NKT-R3 or the Kenwood TH-F7...

Just a thought though :)

In my family we have five UV3Rs all of them have excellent audio on TX also several members of our club have them the TX audio is clearer and louder than any of the big three manufacturer's hand helds, all down to the DSP I suppose. Can't comment on the headset I don't know anyone who uses these.

Hi Mark,

There are many UV-3R owners around here. Most (including myself) have fixed the "quiet TX audio" by:
- setting the W/N menu option to Wide
- enlarging the hole in the rubber cap over the microphone (it is 3 mm in my UV-3R. This mod gives a lot more audio and takes about 5 minutes to do.

I've confirmed my WIDE setting which I did when first received the radio.

Can you provide a link for instructions for the rubber cap hole mod?
Sounds easier for a non-soldering person than a resister change.

Hi Lynn,

I don't know of a link, but I can try to explain:
- remove the antenna
- remove the knob
- open the radio and remove battery
- remove the two visible screws
- take out the aluminum chassis
- on the front side of the aluminum body there is a PC board with the microphone. This microphone has a rubber cap, which you can take off
- enlarge the (tiny) hole to approx 3 - 4 mm
- replace the rubber cap
- re-assemble the radio
- done

Hope this helps

1386. Odd & ends and observations

Yahoo group: UV-3R (2011)
Date: 2011-09-02 12:50:14 UTC
From: W3FIS
Topic: 1386 Message: 1386

Got my UV-3R a couple of days ago. A few observations:

1. Weather monitoring is very handy.. just program in the channel(s) for you area. I put them at the top (99), out of the way, so to speak.

2. Use a SMA to UHF adapter cable (RG174? cable) to connect to any external antenna. With the base station J pole, it works fine as a base station.

3. "No name" 1/4 wave SMA whip that I was using on my FT-60R works fine, more manageable than a Diamond, which is a bit heavy/awkward.

4. Trip to Staples picks up a nice camera case that makes a good travel case. Zipper is positioned so that the antenna can poke out.

5. Thing to try -- RF getting back into the earpiece? Maybe a couple of turns through a snap on ferrite choke? Anybody try this?

6. Mine came with a lanyard -- the URL points to the outfit that makes this. In Chinese, and Chrome died trying to translate it, but it looks definitely like we are seeing a "re-purposed" commercial product again, like the Wouxun and TVT.

7. Neglected to order the programming cable, but one is on the way.

8. How can you remove the goofy pre-programmed channels, other than putting something on top of them??

/paul W3FIS

As far as the goofy channels, I used the programing cable and software and deleted them all. If you delete the first frequency entry in the first column only all the other column data is deleted too. Saves time.

Piet,
I also think about increasing the TX audio. Do you mean enlarging the whole in the rubber cap only or the whole of the housing itself, too?
Since the one in the housing is also very small, that might help also.

I've heard hams doing that as well on other HT. I was told last night I was very quite. I'm going to widen the mic hole as suggested.

Hi Mark,

There are many UV-3R owners around here. Most (including myself) have fixed the "quiet TX audio" by:
- setting the W/N menu option to Wide
- enlarging the hole in the rubber cap over the microphone (it is 3 mm in my UV-3R. This mod gives a lot more audio and takes about 5 minutes to do.

I still have my DT wrist radio! Course it's just a toy.

I can't wait till they come out with the surgically implanted all mode,all flavors radio. Just implant it behind the mastoid area of the ear and presto! The antenna will be just under your skin down the arm of your choice.
Perhaps in 20 years or so Beofeng will be selling one for $35,995! (surgical fees and all band antenna not included)

I notice a slight problem with my HT. The onboard VHF/UHF work great. As soon as I put the sma mini mag antenna. I get intermittent connection. I took the antenna to a commercial radio shop and they check antenna. No problem. It seems that where the sma attaches to motherboard. It's not making a connection. My eyes and not having the right tools keep from tearing this thing apart to solder the connection.

Also my Baofeng sticker has disappeared. It some how fell off with my handling.

Reading up on the chip in the Baofeng, it has all sorts of possibilities for more general purpose rigs. Just for chuckles, line up the Baefeng next to a Wouxun and a Yaesu VX-170 for comparison of size.

I think you need the lanyard/leash for the Baefeng, just to keep from loosing it!

Hi Michael,

To be honest, I also increased the hole from 1 mm to 1.5 mm. Others here didn't do that and obtained very similar results (your choice....).

There was another question about having to remove the antenna connector. This is not necessary. just take off the antenna and the big knob and remove the two screws in the radio is all that is needed.

Thanks Paolo - the first thing i did was listen to myself too ..
and it was very quiet, on out local 2m repeater wide deviation
often causes the repeaters squelch to close for a split second.
so i used narrow on a sked this morning with a great friend who kjnows my voice
and he said try Wide, so i did, and it was a tiny bit better, but it was still too narrow.

i shall try again shortly, see if anyone else comments on low audio,
but it really does seem to be low dev :(

thanks Paolo

Mark

Yes. this really does seem like low dev. mic gain seems to be
reasonable, as far as i can tell. i was hoping a resistor change would be the way to go.
audio from the supplied 'handsfree' is almost undetectable ... :(
- i guess i better get a magnifying glass ready and sharpen the welding torch ...
this unit came yesterday morning from 'solidradio' and was in a brown cardboard
box, as opposed to the colourful boxes .. just in case its a issue with this series.

As far as the goofy channels, I used the programing cable and software and deleted them all. If you delete the first frequency entry in the first column only all the other column data is deleted too. Saves time.

Hi Joel ..

was TX and RXing in Narrow, but speech peaks from some stations shut the squelch on the Baofeng. so RX on wide was the solution. but alas, even Wide TX is very narrow still, and no useful audio at all from the headset.audio strange.
i have very little other VHF / UHF gear at all, being a HF op :)

Hi Marc
There is no way you can compare the Jintong and it's awful muffled audio with the UV3R. I am trying to understand what the issue is with low TX volume as I said there is nothing wrong with our five or the others at the club. These all arrived in brown boxes and came from different suppliers. I have listened via simplex and repeater and via my mobile and base station radios and have not had to turn up the volume to hear VU3R transmisions. Why are ours different?

Here's my take on the TX/RX volume issue.

I have been a ham since 1989 and used just about every HT you could have. I personally owned Yaesu, Alinco, Icom and yes Radio Shack. The folks that design and engineer these units are not dummies. They know the electro/physical concepts of sound. These microphone cushion and case holes are optimized for the particular element used in the mike. I really don't think they have to be modified. If you look inside a 30 year old Alinco, you will see basically the same form of situation. Some older HT's have a wad of cloth over the element. I agree with a previous poster who said "it depends on the set up of the repeater". This could play a part in the audio attenualtion of some incoming signals. My Beofeng is on the way and I probably won't mod it at all. Why should I go through the trouble to mod a $41 radio? Just talk louder like you do with your cell phone cause the Beo probably has the same kind of element.

Hi !

I enlarged the rubber which is over the microphone
to a elongated slot with a nail-scissors.
so no rubber is before the mic-hole and the
sound of the voice hits directly to the microphone.
that was a big positive difference in sound-quality.

i noticed that the 1750Hz tone is to loud now.
it don't open some repeaters. but when i put my finger on the mic-hole,
it works fine.
but i have to make it a bit lover the next days.
there was ever a description in this forum before.

73s,
matt

Hi Matt .. yes i went back and just completely threw the rubber away.
then enlarged the existing 1mm or something case slot to approx 7mm.
and added a tiny bit of acoustically transparent foam, so now the set
just about sounds normal now, when speaking closely,

i had listen-thru on a local repeater during a test QSO earlier
and i was as loud as everyone else . tho i was on wide, everyone else
was on narrow, so i still need a tiny bit more dev :(
so i will continue looking the resistor Mod for TX audio ..
if i find it, i will post. in here.if thats ok,

the TX audio from the headset is still almost silent, could be the headset,
- but i don't think so .. so i'm holding off from buying a spkr / mic just yet.

For those amateurs that are quite used to using a soldering iron I had a look for the resistor change mod on the net, which I'd seen some two weeks ago, but I couldn't find it, so I tried to dreg the depths of my grey cells. Not an awful lot of luck but I do remember that the value of both a resistor and capacitor were changed.....

So... getting out the schematic and pondering, it looks like if R7 (470R) was changed to 220R (or even 100R) the mic level would definitely come up.

Also, I seem to remember that the capacitor across the mic was reduced from 470p. But as this capacitor is probably stopping RF getting into the mic. then we don't want to lose it completely....

Must say the mic level on mine is fine as supplied so it's up to some other intrepid radio amateur to prove the above in the true ham spirit....

1421. 1750 Hz Tone - how to make it quieter???

Yahoo group: UV-3R (2011)
Date: 2011-09-03 12:09:50 UTC
From: bee
Topic: 1421 Message: 1421

Hi !

Is there a possibility to make the
1750 Hz Tone a bit lower???
I can't open some Relais in my area
since I make a bigger hole in the microphone
rubber.
Wenn I put my finger over the mic-hole while beeping,
it works fine.

1422. Programming SW: "Unsupported operation..."

Yahoo group: UV-3R (2011)
Date: 2011-09-03 12:36:05 UTC
From: Bert Braun
Topic: 1422 Message: 1422

Hi all,

the UV-3R programming SW downloaded from the group's file area didn't work for me out of the box.
The SW started up every time with an error popup "Unsupported operation..." and didn't display the a channel chart. Sudden crashs occured reading data out of the UV-3R.

The programming soft seems to use the VB FlexGrid OCX control to display the channel chart. This seemed to be not working correctly.

I've managed to fix the problem by unregistering and re-registering the affected components:

```
regsvr32.exe /u mscomct2.ocx
regsvr32.exe /u msflxgrd.ocx
regsvr32.exe oleaut32.dll
regsvr32.exe mscomct2.exe
regsvr32.exe msflxgrd.ocx
```

Users who have a similar may export the following lines into text file and name this "flexfix.bat" or else. Running this batch once should cure the problem in a conveniant way..

--- Snip! ---

```
@echo off
rem ### Initialize path- and filenames
set WORKPATH=%windir%\system32
set DLL1=oleaut32.dll
set OCX1=MSCOMCT2.OCX
set OCX2=Msflxgrd.ocx

Sounds to me like you were in a noisy environment when you tried this? So the loud audio was mixing too much with the 1750Hz tone and the repeater was confused :) By putting your finger over the mic hole you stopped this happening.

There is no point in lowering the 1750Hz tone as you'd only make it worse in a noisy environment, and in fact when you made the mic hole larger, the 1750Hz tone was not changed - so it is not that that's at fault. It's the larger mic hole.....

Hi dadskids. I think what you mean is that you don't want to hear the 1750Hz tone in the speaker?

Yes, this is quite possible as on the schematic KEY_TONE goes to the audio PA via resistor R10 as well as to the 1846 chip mic input via a resistor and capacitor, R46 and C47 (may not be on the circuit board on some models).

All you need to do is remove R10, which is a 100k.

What windows system are you running?
XP, Vista or Win 7?
If Win 7 perhaps try running the software in XP emulation mode.
Although I have had so much trouble with Win 7 not running most of my test equipment and programming stuff that I've given up on it and bought a couple of old Dell XP based laptops purely for these purposes.

Hi Bob,
- strange, isn't it. prob just a quality control issue or something i expect, considering these are shipped from China for £30, (and that they must be making *some* profit) the cheapness of the manufacturing must be quite astonishing, even knowing they sell these on a huge scale,
- i bet the values on a couple of locally sourced SMD resistors in the pile is likely to be 'variable'

Yes .. i gave my only Jingtong away. audiomwas dreadful wasn't it.
i was just curious as to how these 'new'
cheap sets worked.
well - that, and to keep in contact with the gang at the next rally :)

it'll be interesting when the 12v mobile sets actually start shipping ..
i am having fun guessing how much a 12v 50w mobile dual bander
can be posted over for ...

Ferrite is futile....

Place a 100pf C inside the UV-3R at the earpiece plug, between PTT line
and Gnd, this will cure the problem without having a heavy-weighted
ferrit onto the cable.

Hi Steve. I got mine direct from HK, sent about three weeks ago. The first step of audio on FM broadcast is just a bit less than normal listening level, then yes it does rise a fair bit but only to about half as much again as normal listening level. I guess if you're listening to music you may want it at this level, but it certainly wasn't annoyingly loud.

BTW, I read somewhere that the difference between each level is fixed. As it can only be changed by a minimum 4 bits you cannot get smaller differences between levels.

The only way to attack the problem is to change feedback resistor R15 (100k) down to about 20k (parallel the 100k with a 27k resistor). This is in the feedback network around audio PA chip LM4890. Alternatively, put a 56k resistor in series with the loudspeaker.

From: DavidN
Topic: 1376 Message: 1446

Hi Mark, managed to find the mod in the end... Google didn't know of it but a severe racking of the grey cells found it in mods.dk

Apparently the resistor I talked about R7, a 470R, you bridge, and the resistor that supplies the condenser mic volts (R1) you reduce from 470R to 100R. This really peps up the tx audio. Photos and full details here:

http://mods.dk/view.php?ArticleId=4804

Also on this page is a link to the schematic (a PDF file) for those who wish to delve.... :)

thank you for your answers.

i am sitting in my silent living room and not
in any noisy environment.

I've have nothing against hearing the ton,
but not so loud.

is it possible to increase the value of R10
to make the ton quieter?

The software shows memory locations 1 through 100. However, I seem to be only able to access 1 through 99. Am I missing something?

Also a printout of the memory, etc., from the software shows a "comments/notes" column, but the software doesn't allow for setting it.

The "Priority" mode - via software -- seems more like the "Dual Watch" feature I have on my Wouxun HTs.

1452. New poll for UV-3R

Yahoo group: UV-3R (2011)
Date: 2011-09-05 10:44:14 UTC
From: UV-3R@yahoogroups.com
Topic: 705 Message: 1452

Enter your vote today! A new poll has been created for the
UV-3R group:

How much MORE Would you pay for a UV-3R-mk2 without known problems? (VHF 2nd harmonic, loud volume, VHF TX lock with earpiece)

o I wouldn't, it's perfect like this
o +5 USD
o +10 USD
o +15 USD
o +20 USD or more
o I fix it myself :-)

To vote, please visit the following web page:
http://groups.yahoo.com/group/UV-3R/surveys?id=2695586

Note: Please do not reply to this message. Poll votes are
not collected via email. To vote, you must go to the Yahoo! Groups
web site listed above.

Thanks!

None of these issues are show-stoppers for me. I'd fix them myself if I was capable of working on such small stuff.

What would make me shell out for another Baofeng would be a version with DTMF keypad. It would be great for Echolink.

I tried the large ferrite choke that came with my FT-817ND. Took THREE turns through the core. Problem solved. Next trip to Rat Shack, I'll see if I can find the larger choke size that will fit two turns, and see if that works. The FT-817ND choke is a bit bulky. Avoided doing an internal mod.

As my mechanical engineering friends say, "get a bigger hammer."

Increasing R10 will both affect the 1750Hz and the key beep. I've changed R10 up to 660k (2x 330K 0805) and found the beeps in the speaker now acceptable loud.

But with increasing R10 to such a high value, the 1750Hz on TX is much to low now for certain repeaters. So I've decided to feed the 1750Hz directly into the modulation input of the RDA1846:

I've populated C47 with a 100nF 0402 for DC decoupling and placed a 220K 0402 for R46. This seems to give an approbiate loud 1750Hz tone directly injected. Another benefit now is that the 1750Hz is available even with the earpiece plugged in.

I still have to check the correct FM deviation and tune R46 precisely for a proper value, but 220k is already a good approximation.

Since some here are replying to a message that we aren't supposed to respond directly to...I'll put in my two cents as well. LOL

The only catagory missing in the original set of questions is $0.00!

Why should anyone have to pay extra to fix a problem that should not have left the factory in the first place?

Don't get me wrong I like this little radio, but really, these small issues should have been engineered out before production started.
Like buying a new car with a leaking windshield and then being asked how much extra you would pay for the same car with no leaks!

Regards,
Jake

1465. Re: [UV-3R] New poll for UV-3R

Topic: 705 Message: 1465

Hi.
I am the one who created the poll and I would pay 5USD more to get a fixed mk2 UV-3R, even if I am able to fix it myself.

Note that in spite of getting one of the few defective units, with VHF RX not working, I bought a replacement before returning my UV-3R body to HK for repair/replacement.

The fact is that the user base has approved the device and has also provided a fix for all known problems. The producer would only need to fix the production process even without going back to the design engineers, and they would throw into the market a slightly better "junk". I agree with Jake saying that they should implement fixes at no extra charge. But in my opinion with a little $$ contribution the factory could also invest in post-production quality control, which is apparently not applied.

According to a side-by-side test with UV-200, it does not address known UV-3R issues at all. It's just different cosmetics, even if it appeared few months later. In my opinion there seems to be no interest in producing a better quality rig, unless consumers ask for it.

Why am I asking? I feel that giving such a large consensus to cheap RTXs with neither QC behind them nor a design review process will bring in more and more lousy HAM devices. This could be good for our beloved hobby survival, but bad for the search of perfection started by of our "fathers".

Thank you all for your friendly contributions. Let's close the discussion and focus on technical aspects instead.

Let's hope (ask the factory?) for a reviewed radio at no extra cost then!

Paolo IK1ZYW

1466. How many UV-3Rs are out there I wonder?

Yahoo group: UV-3R (2011)
Date: 2011-09-06 07:42:54 UTC
From: Naqoyqatsi (aka the ICM)
Topic: 1466 Message: 1466

Although there are complaints about the QC of the UV-3R I wonder if the appearance isn't skewed by the common situation of yahoo group users often consisting of those who love something versus those who don't?
It would be interesting to know just how many of these tx/rx are actually out there.
For example I know of around 9 of the things at my local club at the last meeting but as for people being on the yahoo group, I was the only one.

I also came across something at the club which I've seen in the industry for years (and on this group as well). That is that many people appear to not have even glanced at the user manual before trying to use the rig. Then when it doesn't do what they think it should, how it should, they still don't read the manual they start to complain and demand help. One person at the club didn't even realise there was an FM broadcast radio on the thing. (By the way it seems it won't switch into FM radio mode if there's a strong signal on whatever frequency you're tuned to on 2m/70cms so before you send it back as faulty check that first.)

If I sound cynical it's because I am - too many years in the business, dealing with people who don't even follow the old adage "If all else fails - read the manual"
This is the thing that blows up finals, blows up power input circuitry and does untold other damage because people just don't read the manual first ! ! !

OK moan over - off to the workshop to see what delights await me today.

1467. UV-3R problems ?

Yahoo group: UV-3R (2011)
Date: 2011-09-06 08:34:34 UTC
From: jsilberman
Topic: 1466 Message: 1467

My 2 cents, What on Earth do you expect for $50 ? It was probably priced that way because it was either to complicated to work easily, for an HT, and not accepted by the hams in their country or / and it had problems and they didn't want to just throw them out so they pumped them out at a cheap price to recoup some of their investment. I like my "R" even with it's problems.

From: W3FIS
Topic: 1466 Message: 1468

If you look at the circuit diagram, it is essentially TWO chips. That goes a LONG way toward keeping the cost down. The manual is a little thin in some areas, but simply RTFM, sit down, fool with it a bit, and read the manual a SECOND time. Does anybody yet understand the "Emergency Channel"??? Channel #100 with the software??

The only design/QC problem I have encountered is the RF pickup in the ear piece, which is cured with a ferrite choke.

I did find that the belt/pocket clip tends to loosen up. A SMALL drop of epoxy takes care of that. I've had to do that on my Yaesu and Wouxun HTs anyways.

I think the real issues are 2 watts and a small antenna. That is to be expected.

I have run mine without charging for a couple of days. Still going fine. Put it on charge last night, as I'll be "out and about" with it most of today.

I think it is a conscious cost decision. It's cheaper to let the customers do the QC than do it yourself. In fact I seem to recall there was a manufacturer of cheap home audio systems here in the UK a couple of decades ago that worked the same system.

If your main market is domestic retail it isn't really a problem for the manufacturer just to replace faulty units when they are brought back to the shop. It's only a hassle for people buying mail order from overseas where the cost of sending it back is almost as much as the thing originally cost.

I don't consider 2 watts to be an issue. There is very little you can't work with 2 watts you would with 4 or 5. It also keeps size and weight down and allows the use of inexpensive cellphone batteries. There is no way you would get more than 2W out of a 3.7V battery pack, the current required would be too much.

A common complaint with the small HTs that can run 5W is that they get too hot to hold due to the heat dissipation required. As for the antenna, that's up to the user. Personally I don't seem the point of putting a big unwieldy antenna on a tiny radio.

From: Leigh L Klotz Jr WA5ZNU
Topic: 1466 Message: 1471

John,
I think the device is simply inexpensive to manufacture. The form factor and power specs are a copy of the Yaesu VX2 and VX3, at about 3x the price. The Yaesu has more features (including a 455KHz - 999 MHz RX) and better performance, but a much higher parts count. The bulk of the UV-3R is a sinle radio chip plus a single microprocessor chip, and the cost of these two must be low enough that the $50 price is easily achieved.

Great Bert. Thanks for clearing this up as I thought that C47 and R46 were just links on the board and hadn't realised they weren't present and that the tone gets to the mic input on the chip via the loudspeaker! I guess they took those components off as it saved a couple of pennies :)

I think people need to remember that these radios were originaly intended for the chinese domestic PMR market. There is a very large construction industry there, bringing the chinese infrastructure and buildings into the twenty first century. There is a need for cheap throw away radios for workers to keep in touch on big sites they needed to be cheap so that they cost practicaly nothing to replace when they are dropped off tall buildings, dropped in mud and driven over, and probably dropped in concrete. They do what they are designed to do. It is us radio amateurs who decided to use the radios not the chinese making them to sell to us so we should not be critisising them, remember the old saying "You get what you pay for". For me they are a great little throw away radio, better than the VX3. Nice and easy to stick in a pocket. They are simple and easy to use I have used mine for a few weeks now and am perfectly happy with it so are my sons with theirs, and several other club members who have them. It would be nice if the manufacturers too on board the mods but if they don't I won't shed a tear over it.

Most of the fixes can be done with only parts changes, not redesign, so the cost of doing it should be a one-time fee plus about 5 cents for the LPF capacitor. The LPF may be a problem because they seem to need it removed for their high VHF market (non-ham). So the real cost is a dedicated ham device. A bigger ham market is all that is needed for them to justify the fixes, as there is almost no per unit cost.

I suppose if someone (a ham dealer) were to place an order for a big enough batch they could specify whatever mods they wanted to be incorporated. One of our ham dealers here has done that with Wouxun to get a dual bander that covers the 2 and 4 metre bands.

Car manufactures do the same, cheaper to take chance on failure than to test on asembly line. Same goes for running changes, they look at incident rates and spin the dial to see if they want to fix before end of model year run. Some companies are more likely to fix than others but they all play the same game to a certain extent to save $$.
I would guess this company was making the radio for Yeasu and reverse engineered it to fit same case, they are identical. The build pile is larger than assembly can keep up with so running changes take a while to catch up. I believe they will eventually catch up with changes as they are simple and no cost items to fix.
For M3CW it is a great rig to keep at office for monitoring and occasional contact. Great for weather and monitoring the business band for company I work for.
Waether along is almost worth the $$.

For what its worth, I bought two of these units right off the bat. Absolutely no issues what-so-ever. Maybe this is because I have very little to compare and contrast the unit with as I'm fairly new to the hobby, but I think it's a great little unit, good value for money when compared to the other stuff available. The software works like a dream (easier than CHIRP IMHO). If I had one gripe, it would be the twin antenna thing, but that was easily sorted out by purchasing the cheap but functional 701. I found it easy to get to grips with after consulting the manual and advice easily available in this forum. Frankly, if you can't work the radio, you must be a simpleton or, as has been commented on, you didn't read the instructions and had over optimistic expectations. Does what it says on the tin!

Although there are complaints about the QC of the UV-3R I wonder if the appearance isn't skewed by the common situation of yahoo group users often consisting of those who love something versus those who don't?

It would be interesting to know just how many of these tx/rx are actually out there.

For example I know of around 9 of the things at my local club at the last meeting but as for people being on the yahoo group, I was the only one.

I also came across something at the club which I've seen in the industry for years (and on this group as well). That is that many people appear to not have even glanced at the user manual before trying to use the rig. Then when it doesn't do what they think it should, how it should, they still don't read the manual they start to complain and demand help. One person at the club didn't even realise there was an FM broadcast radio on the thing. (By the way it seems it won't switch into FM radio mode if there's a strong signal on whatever frequency you're tuned to on 2m/70cms so before you send it back as faulty check that first.)

If I sound cynical it's because I am - too many years in the business, dealing with people who don't even follow the old adage "If all else fails - read the manual"

This is the thing that blows up finals, blows up power input circuitry and does untold other damage because people just don't read the manual first ! ! !

OK moan over - off to the workshop to see what delights await me today.

Yes, they possibly found that the acoustic coupling from the speaker
into the mic was sufficient, so they left the components for direct
coupling away.
It is by the way the only TX tone signal, which is externally generated
by the MCU as the RDA1486 generates CTCSS as well as DTMF and DCS tones
by itself.

I agree. I can hit our repeater with 2 as well as with 5 watts.

>It also keeps size and weight down and allows the use of inexpensive cellphone batteries.

Not only are they cheap, they are easy to get. I really need to have a spare, "just in case."

>There is no way you would get more than 2W out of a 3.7V battery pack, the current required would be too much.

Specs say something about 1 amp draw on the battery.

>
> A common complaint with the small HTs that can run 5W is that they get too hot to hold due to the heat dissipation required.

I used my FT-60R one evening -- with speaker mic and adapter to my J pole - to run a net for an hour. It was pretty warm at the end of the evening!

> As for the antenna, that's up to the user. Personally I don't seem the point of putting a big unwieldy antenna on a tiny radio.

I have a wire whip 1/4 wave that is light enough so that it doesn't unduly strain things. I do agree, the stock antenna is perfectly acceptable the vast majority of the time.

My perception is that the stock antenna seems to work better on 70 cm than 2 meters for repeaters that are of comparable distance from me.

Anybody have any information on this?

All things considered, it is a LOT of radio for the money. Out shopping today, and simply put it in my pocket. Can't beat that.

I think it's an excellent Handie Talkie for what it is (about £37 including p&p from Hong Kong). Perfect for a beginner to start in the world of Radio Amateur. Here in the UK you can get your Foundation license and this Handie Talkie for under £100 all in to start. Now compare this with lots of other hobbies!
I bought one because at my local Radio Amateur Club lots of HAMs have them too and I don't have a base VHF/UHF rig, only HF. So also for me this was an easy and inexpensive way to enter the 2m / 70cm bands. This will also get more HAMs on the 2m / 70cm what is a good thing as you never know we might loose it if we are not using these bands. I use mainly repeaters and that works very well.

See that there's now a Mark II version of the UV-3R available....

The only difference seems to be the display - it's dual display so can show the 2m and 70cms frequencies at the same time..... In the UK (from HK) it's £34.00 instead of £31.00 for the Mark I. It comes with one antenna.

About those weather stations!

I put in the local one (162.475 Richmond, VA) and the S meter bar shows full signal (all segments on) but it will not open the SQL. If I hold VOL or set SQL to 0 then I can hear it, loud and clear.

Switch to a repeater (154.430) in the next memory slot and SQL works just fine. Any ideas about this odd behavior?

I picked up my black UV-3R at the Shelby Hamfest (Dallas, NC). I was going to order one from http://www.dealextreme.com/ but since it was right there in front of me I could not stop myself!

This is my first post, thanks for letting me join the group!

1501. Re: What is ElayM

Yahoo group: UV-3R (2011)
Date: 2011-09-07 14:05:40 UTC
From: Wal Wal
Topic: 1303 Message: 1501

Hi,
I've tried the RelayM feature listening to an half duplex VHF meteo station
I was wondering about full duplex was supported and found how relayM works:

the station frequencies are TX(a) and RX(b) (a&b are 2 different freq - set shift & offset)

programming uv-3r channel with RX(a) and TX(b) allows to listen the station & half duplex

programming uv-3r channel with RX(b) and TX(a) just allows to TX on a
programming uv-3r channel with RX(b) and TX(a) and using the RELAYM allows to TX on a BUT keeps the RX on a.

We have to test if it really does full duplex using two uv-3r programmed with TX(a) and RX(b)AND RelayM

Without relayM you would not have any communication
With relayM if it is setting "real full duplex" it will work

so good test

Jack,

THANK YOU! Spot on.

If you start editing a new frequency from a previously saved one all the RXcodes and the like are still set. Learned something about programming the radio by hand.

Now to fix a few other memory slots...maybe I do need that data cable after all.

Thanks again!

Hi all.

I just ordered two UV-3R radio from a vendor on eBay in Hong Kong. Just getting back into Ham Radio after a few years off. I was first licensed in 1983 and obtained US amateur extra in 1985.
The only 2-meter gear I have now are two mobile rigs I inherited from my silent key father in 2009. I'm in the process now of obtaining a base station antenna to install them at my house. But I needed some handhelds. (I also have some HF gear installed.)
Don't know if it's goofy or not, but I ordered a red and a blue UV-3R. My wife has also been licensed for about 12 years, but never been on the air. I'm hoping these handhelds will help get her on.
Looking forward to learning more about these radios. I think mine have been shipped, but having ordered stuff from Hong Kong before, I know it can take a long time.
Thanks,Darvell (N7LN)

Thanks for the welcome, Lee. I did not get the cable. Perhaps I should have read more before ordering. I'll see how things go, I guess.
Over the weekend, I ended up having to run antenna cable from my basement office to the attic, where I'm planing my antennas. The only path I could find was through my heating vents, which I'm going to patch, but the wife rolled her eyes at that one. LOL.
One of my kids said, "I can't believe Mom let you do that!" I told her it was my house, but maybe the kids know better. But, I think I'm good for now. :-)
I'm in the process of making an emergency "grab and run" briefcase radio kit, of which at least one of these new radios is going. I also have a portable MFJ QRP 20 meter rig with 2 antennas and a portable tuner (a stick for quick setup and a dipole for when I have a little more time) and I'm getting a 10m/12m handheld, which will also go on CB (it's for emergencies, what can I say?), as well as a 10m dipole to hook to it for when I have more time. I'm thinking about adding a 40m MFJ rig as well, but not now.
Anyway, looking forward to finding out more about these little guys.

Did you order one with the USB programming cable? It makes
it a lot easier. I have my UV-3R hooked to a Cushcraft Dual-Band Base
station antenna that hangs from a ceiling plant hanger in my living room in my apartment
and it works great. Sometimes it is nice to be divorced. What wife
would let you hang an antenna in the living room? Welcome to the group.

Welcome to the group Darvell and also welcome back to ham radio! I, like you, was off for a number of years and came back about two years ago. I'm really enjoying being back and have just moved from an apartment to a house, so now I can put up some antennas! :)

The main thing with the UV-3R is to put a decent whip or external antenna on it. Myself, I've not found programming it manually a bore, but there aren't too many repeaters round here....

Anyway, enjoy! And getting a red and a blue one sounds just about right to me! :)

Best 73s, .d. G4TUP.

Hi,

I've tried the RelayM feature listening to an half duplex VHF meteo station

I was wondering about full duplex was supported and found how relayM works:

the station frequencies are TX(a) and RX(b) (a&b are 2 different freq - set shift & offset)

programming uv-3r channel with RX(a) and TX(b) allows to listen the station & half duplex

programming uv-3r channel with RX(b) and TX(a) just allows to TX on a

programming uv-3r channel with RX(b) and TX(a) and using the RELAYM allows to TX on a BUT keeps the RX on a.

We have to test if it really does full duplex using two uv-3r programmed with TX(a) and RX(b)AND RelayM

Without relayM you would not have any communication

With relayM if it is setting "real full duplex" it will work

so good test

Sound like the CTCSS is on the wrong setting try turning the CTCSS off or going through the different tones and see what happens

maybe the radio is on Narrow band and/or the CTCSS is enabled.

Same here. Rather strange that a full "s-meter" bar graph is quiet for the
weather band.

Hi,

does anyone know where the electronic components R30 and C38 are located on the pcb?

A friend of mine wants me to modify his radio, so that he can use an external speakter mike without losing most of the audio volume.

Unfortunately the PCB serigraphy does not carry component numbering,
so all pictures are not useful for locating a component. Not even with
the acutal radio open under your eyes.

What Alex (and myself too) is looking for is a "parts placement
diagram" (ask Google Images for some sample pictures), which is
usually included into service manuals (of Japanese-made radios). The
said diagram is not available through this group's Files area. Or at
least it wasn't two weeks ago, when I looked for it.

73,
Paolo IK1ZYW

PS: I want to try to fix the VHF RX chain of my "R", I need to locate
them on the PCB. Maybe they are on the speaker side of the board, as
pictures show a good candidate components group there, similar to one
on the other board side. They are two layouts looking very similar,
for VHF and UHF RX chains.

Yesterday I would have answered: "only cosmetics".

Today, after reading the announcment of a dual-frequency display "R"
(the "mark II"), I wouldn't anymore: other improvements could have
been made to the UV-3R firmware too.

Mr malsam,

> If you look in the photo section on the site you will find a complete circuit diagram.

of course, I know it is there. But a _circuit diagram_ is NOT a _components placement diagram_. The latter is the graphical representation that links the circuit/schematic diagram to the actual PCB. That is what we are looking for and, unless you post us a link to the file, it doesn't exist.

It must look like this:
http://www.falara.org/tektalk/GPOAmp_files/image006.jpg .

The difference between the UV-3R Mark I and the 100 and 200 is purely cosmetic, the electronics are exactly the same, but the buttons and case are different shapes....

But the UV-3R Mark II may have update differences in the electronics, tba.

1533. Will the UV-3R Mark III use this chip?

Yahoo group: UV-3R (2011)
Date: 2011-09-08 13:08:05 UTC
From: DavidN
Topic: 1533 Message: 1533

Due out first quarter of 2012, but now being tested by selected individuals, is the MC13260 chip, similar to the 1846 chip in our UV-3Rs. Its frequency range is 60Mhz to 960Mhz (3Ghz by adding a low noise amplifier), and includes a 32bit ARM9 processor, modem and of course RF transceiver.

Could we see a plethora of UV-3Rs with different frequency bands e.g. 4m, for little more than the present cost of the UV-3R? And could we see then the high prices of the big three strongly challenged?

WOW!!!!!! I think this will make some waves. That product brief gives the example of digital voice modes. I'm willing to bet DVSI will never let their codecs run on anything other than chips they program. But what a platform for something like Codec2!

Here: http://homepages.paradise.net.nz/peterfr2/QAM.htm is a program that can do 400kb/s over a wide FM broadcast band transmitter. Sadly, it's closed source. I wonder how fast of a data rate you could have over a normal 2m/440 link with QAM16 or QAM64 modulation?

The ARM9 processor might not be powerful enough to handle Codec2, let alone a complex modem though. I haven't read anything about Codec2 being ported to embedded processors lately.

Just think of the possibilities of software modems for AFSK packet, GMSK (D-Star digital data modes? Even without voice I guess you could do dprs, d-rats, or slow-speed file transfer), or stuff like PSK31, SSTV etc. Put a camera module meant for a phone and a low-res phone lcd on a radio. http://www.sparkfun.com/products/569 "Color LCD 128x128 Nokia Knock-Off" $14.95 and http://www.sparkfun.com/products/8667 "CMOS Camera - 640x480" $9.95 which has a digital output though obviously you'd have to figure out how to connect it which would cost more than the bare module.

I wonder if the ARM9 does the DSP work of decoding the signals? It appears so in the block diagram. Though, it might be another built in function of the ARM9 system-on-chip. There seems to be a dedicated "modem" block. Also dedicated "Receiver" and "Transmitter" blocks. So I wonder if it's fixed to FM only or if it'll be possible to do other modes too?

WOW!
Most important radio development in a long time if you ask me.

Topic: 1490 Message: 1539

I'm waiting for my two radios currently being held in customs however, there is no dual-display on the original UV-3R as there is on the ebay-linked one or am I completely mistaken?

1540. software help needed

Yahoo group: UV-3R (2011)
Date: 2011-09-08 15:09:55 UTC
From: w5rz
Topic: 1540 Message: 1540

I got two UV-3R's a couple of days ago and they are amazing little rigs for the price. I got the programming cable with the DB9 serial connector. Thanks to this forum for clearing up a few things, like the Chinese setup/English program. I still don't have it working, though. Here's the setup:

Laptop with XP with a real serial port.

Software version 1.01.01

I'm confused about the "Radio" selection in the program - couldn't find any info so I left it on the first setting. (87M0) I saw 103M9 used in a photo and tried that - no joy.

Always get "failed to connect radio" when reading or writing.

I saved and opened a small file with a few frequencies and tried to write that, but no luck.

My plug looks OK, is the same size and the speaker/mic, and the red transmit light does not come on when it is inserted.

ONCE I was able to read from the radio without knowingly doing anything different, but I got an error that closed down the program. I should have noticed, but it was probably the NK7-3R referred to in other messages.

I thought XP with a real serial port would be easy, but apparently not for me!

Any suggestions welcomed -
73,
Dennis, W5RZ

I believe the radio (referenced as Mark II) is actually a new model that does have the dual display. The 409 shop folks have it as well and are getting about 10 bucks more for this model. See http://www.409shop.com/409shop_product.php?id=106279 I do not know if in the model they have corrected the volume and intermod issues of earlier UV-3r's. You are correct that the earlier uv-3r's are not dual display.

This setting is not important for basic data communication: It just
presets the rig's FM radio to the specified frequency, read 87M0 as
87,0MHz and 103M9 as 103,9MHz.

> Always get "failed to connect radio" when reading or writing.

Check, if there is another program, possibly a kind of Sync Software or
else already attached to the COM port you wish to use.
Check the program icons in the lower right corner if one of them uses a
serial port.

> I saved and opened a small file with a few frequencies and tried to
> write that, but no luck.

How does the program window of the prog SW appear? Has it already an
empty grid visible? Did there some error messages pop up when the
program has been started? "Unsupported operation..."?

> My plug looks OK, is the same size and the speaker/mic, and the red
> transmit light does not come on when it is inserted.

Is it a ready-built cable or one built by yourself?
If it is a homebrewed cable, did you treat RxD and TxD correctly, i.e.
not crossed over? What kind of level converter did you use?

> ONCE I was able to read from the radio without knowingly doing
> anything different, but I got an error that closed down the program.
> I should have noticed, but it was probably the NK7-3R referred to in

You may try the OCX fix batch, which I've uploaded to the Programming SW
folder of this group a few days ago.

> I thought XP with a real serial port would be easy, but apparently
> not for me!

In fact it is, but the COM port needs to be free of any other program's usage, otherwise the Programming SW will not be able to allocate the port for itself.

?

Just curious if any of our members has recently purchased their UV-3R and still find the FM radio volume an issue. I've had mine since the end of May and it exhibits the classic barely audible in first setting but annoyingly loud at the second setting. Thinking of picking up 1 or 2 more and just wondering if the issue has been corrected. Thanks to all for your time.

I wonder if anyone has happened to measure the frequency of the 1750Hz tone
on a frequency counter, as I see in the datasheet for the MCU chip that
generates it (a MC81F8616) that it can't generate 1750Hz exactly, it's
either 1736 or 1786Hz. Will some repeaters baulk at this?

Tim,

What about commercial FM broadcast stations? I could not receive any in my metro area of powerful FM stations without changing the antenna. I would like to know your experience with 2 meters. I have not tried 70cm, and maybe that is where the antenna is optimized.

I decided to try the 2m/70cm antenna from my old T90-A Icom HT. Wow!! What a difference. FM broadcast and the big repeater were what I expected. The new dual-band UV-3R antenna seems poor to me. I could not open the repeater with the OEM antenna while running 2-watts. I have opened the repeater from the same location with 200 mw and a short antenna on a RS HT. Anyone else have this experience?

SMT is a pain to work on, but, if you can't solder with confidence in tiny places, a few bucks more might be worth it to some. You get what you pay for. Its a great little inexpensive radio with some small issues. I'll get around to"fixing" or "upgrading" with suggestions from the board. IMHO, this shouldn't be your primary radio. Part of the lost, well, somewhat lost art of Ham Radio is tinkering. If you can, use this radio as a learning experience to do that and enjoy the fruits of your "labor". If not, enjoy it as is and have fun! ....join a local club! Most have a bunch of engineers that would enjoy giving anyone a hand both learning the ropes and even "elmering" you through a project.
Best of Luck Everyone

And also.....

Looking through the RDA1846 Programming Manual, section 13 (TX FM DEVIATION) includes this:

*Adjusting 43H [12:6] (xmitter_dev) can change Tx FM deviation of voice and subaudio.

And note that:

In RDA1846 each register write is 24-bit long, including a r/w bit,7-bit register address, and 16-bit data (MSB is the first bit).

R/W A[6:0] D[15:0]

Anyone fancy having a go? :)

Righto.... managed to have a play this afternoon and the squelch is very strange!

Obviously position 0 is open squelch all the time.

Positions 1, 2, 6, 7, 8 and 9 are all the same, allowing the weakest of signals to open the squelch and going down to nothing before the squelch closes
Positions 3, 4, and 5 are all the same and do not allow weak signals to open the squelch.

I was listening to two stations having a QSO - one was 5.1 and the other 5.4. The first positions allowed both signals to open the squelch, the second positions only allowed the stronger signal through.

And.... I don't know if it was my ears :) but the audio quality *seemed*cleaner on positions 6, 7, 8 and 9, as if the DSP was working harder.....

BTW, my version of the UV-3R is the one with 18 choices in the menu and step sizes of 5/6.25/10/12.5/20 and 25kHz.

1558. Call For Help

Yahoo group: UV-3R (2011)
Date: 2011-09-08 19:25:12 UTC
From: UV-3R-owner@yahoogroups.com
Topic: 1558 Message: 1558

Were now well over 1000 members strong and growing every day!
Thank you everyone for creating a truly helpful community around this little wonder.

As the group has far outgrown what one can moderate I am looking for one or two people who would be interested in being moderators.

The ideal candidate is someone who keeps up with the radio and participates with the discussions of the list.

Duties would be to approve new members, and approve messages that are incorrectly flagged as spam.

If this sounds like something you would like to help with please reply.

Thanks / 73s
Bill

1559. Re: software help needed

Yahoo group: UV-3R (2011)

From: w5rz
Topic: 1540 Message: 1559

>Radio setting:

> This setting is not important for basic data communication: It just
> presets the rig's FM radio to the specified frequency, read 87M0 as
> 87,0MHz and 103M9 as 103,9MHz.

Wow - that makes sense and I thank you!
>
> Always get "failed to connect radio" when reading or writing.
>
> Check, if there is another program, possibly a kind of Sync Software or else already attached to the COM port you wish to use.
> Check the program icons in the lower right corner if one of them uses a serial port.

Negative on both of these. Device manager reports the serial port active and ready to go and not being used by anything else. Last used COM1 at Field Day with an interface for rig control and CW. Of course, that is not loaded now.

> How does the program window of the prog SW appear? Has it already an
> empty grid visible? Did there some error messages pop up when the
> program has been started? "Unsupported operation..."?

No error messages at startup. It opens with the grid with one frequency loaded. When I open my test file, I have three frequencies there.

> Is it a ready-built cable or one built by yourself?

It's ready built and came with the radio.

> You may try the OCX fix batch, which I've uploaded to the Programming SW folder of this group a few days ago.
>
Will do that - thanks bert!

I keep thinking it's some silly little thing I don't have set right. Are there any menu items or settings on the radio that are critical to getting the software to communicate?

73,
Dennis

It looks like this new model comes with a dual band antenna instead of two
single band antennas.

73,
Mike - AD4MC

From: Bill
Topic: 1490 Message: 1561

Looks like you are correct. I have an Icom FA-S270A dual band antenna which looks to be about the same size as the included UV-3R MkII one. This will make for a good comparison as I am very happy with the local performance of it.

Looks like I am going to hold off on my purchase of an extra UV-3R till I see some reviews of the new Mark-2 version. I just may have to get that one instead :-)
I know many say 5 watts is not needed but I wish they would put out a 5 watt version of the UV-3R! Please ???? Just my opinion.

Thanks for maintaining the great list! I'm not in a position to moderate,
but I would be interested in having every posting moderated to
reduce irrelevant or repetitive posts. I realize that means a lot more work
for someone but since you're seeking volunteers maybe there may be the
manpower to do it. Thanks!

I've been on fully-moderated lists and they are decidedly NOT friendly. I've not had too many occasions to delete messages in this group, so I'm not sure why you're calling for moderation on every posting. The problem with that is the pace of the list slows to the availability of the moderator(s) to keep up. Quick answers to questions nearly never occur and rapid-fire e-mail diagnostic sessions are non-existent.

As long as membership is not open and requires approval, and the moderators provide some filtering of the membership requests, I don't foresee a problem here. The lists that get lots of spam postings are those that have open membership.

My vote goes for keeping this list as it is. Redundancies are a sign that there are numerous folks willing to help and answer questions. If any small handful of members consistently gets off-topic or generates flame wars, they can be individually moderated, the whole group doesn't need to go with it.

It would be nice if the manufacturers too on board the mods but if they don't I won't shed a tear over it.
>
> Bob G1BCZ

Hello Bob,

100% fully acknowledgement!

For long years I left my interest on HAM-radio go, only listening the "forbidden radios" (police, ambulance...) but now -by coincidence- I found that little nice "toy" and I return to study the books for the german HAM-radio licence, aditional my new wife is electronics technician for industrial switchgears so I invite her to study with me together :-)

34 US$ (24,22 EUR) are not to much, the whole 2m and 70cm band is covered, additional the PMR on 446 MHz (only accredited rigs in Germany!!), the speaker-mic can used further with an VX-3 or other brands, so what shall I say?

So I expect the delivery, try to mod the unit with my wife together, study the making off of antennas and hope to get the license in future.

OMHO: I mean that this cheap rx/tx is affordable to all people who are interested on HAM-radio. Not spending thousands of bucks for an YAESU, Kenwood or other, for the beginnig it might be ideal, later they (and my2) can spend all their money in 1st class brands ;-)

Thanks all for your engagement on this radiounit, thanks for HAM-SPIRIT, thanks for answering all questions and hope to receive somebody later in the air!!

Ragards and 73,

Oliver

See http://www.409shop.com/409shop_product.php?id=106279 I do not know if in the model they have corrected the volume and intermod issues of earlier UV-3r's. You are correct that the earlier uv-3r's are not dual display.

Maybe 1st they will sell out the single-line-display, than the sell the double-line-units.

Did some sellers still sell the oldest version with 9' menu?

The older units gets a few bucks cheaper in the last days, but it could be foundet on the US$-EUR-rate.

We will see...

OMHO: The hk360radio ist more expensive than the mega409shop, OMHO

Topic: 1490 Message: 1573

I have two new UV-3R's coming in the mail, if they ever get here from Hong Kong, that is (and I may order another because of info I've gotten here about the enhanced screen/dual-band antenna version that's now on eBay). But, I have a question.

Why is the programming cable useful? What sorts of things do you program from your computer? Is it not easy setting up the radio from the control panel? I've never had a 2m handheld that you could program with a computer, but I must admit that I haven't been on UHF/VHF for awhile.

I'm just curious if I should be ordering a cable for my new radios.

Topic: 1490 Message: 1576

This radio has NO assistance when it comes to setting up repeaters into the memories. No auto-offset, no nothing. I started without the programming software and getting the 6 or so repeaters I wanted set up was a bit... well, a bit.

I've since acquired the programming cable and the software that came with it and could have accomplished the same thing in about 2-3 minutes whereas it took me the better part of 30 minutes to do from the front of the radio. And much less room for error as well.

That said, I certainly learned my way around the menus, shift offset tone, so I can actually set up a new repeater in the field if I drop out of the sky into a new area without my laptop and cable, but how often will I be doing that, I don't know.

YMMV and it depends on how good your eyesight is and how much you enjoy pressing little buttons on the front of a tiny radio.

Lynn (D) - KJ4ERJ - Author of APRSISCE for Windows Mobile and Win32

PS. I actually LOST my UV-3R today while out walking. Luckily I had a GPS tracking me so I backtracked my exact steps and managed to find it laying in the grass before resorting to plan B which was to call my wife at home and have her call me on the repeater as I re-walked the trail to see if I could hear her calling (yes, it was on when I lost it). Chalk one negative for the newly installed "belt" clip rotating and allowing the unit to fall off the belt. It's so small and light, I never noticed it gone until I reached back to unhook it before climbing into the underbrush to look for a geocache.

Hello Tim,

could that be that Watson than rebrands the chinese crappy fake?

For that I think its better (and money safe) to order than the original Diamond or ICOM Antenna without testing arround.

I believe some parts are generic as I see them under several brands. Not sure on quality as I have limited experience with brand.
I am in US but have RSGB membership and receive Radcom and watch adds in magazine.
I have had good experience with Diamond and Comet brands on HT's. I had good results from testing SMA3 model from Comet.

Awesome for our north eastern winters :-)
Just joking.

Anyhow, did anyone notice in all the pictures of the Mark-II on Ebay, that the display is showing a "188" where the channel is normally displayed? The advertisement states 99 channels plus 1 emergency channel. I wonder if this is going to be a new surprise for new owners that was not documented just yet or it is a pic of a beta. Have a look.
If that is true, I wonder what else has been added? I think I am going to order one in the morning.

Okay, so I just "upgraded" my radio order. A week or so ago, I ordered two UV-3R radios, one in red and one in blue. Supposedly they are on their way.

Then I learn here about the dual-display with the dual-band antenna. So, I ordered one of those today, too. I figured if I don't need the other colored ones, I can either sell them locally (who wouldn't pay $50 for a new 2m/440 radio?) or toss one in an emergency kit. Either way, I'm not out much.
For the dual-display, I also added the 19cm antenna dual-band antenna, a bnc connector, a programming cord, and 3 extra batteries (one for each radio I have ordered). Not bad for about a hundred bucks or so, including shipping.
Now the wait. Yikes.

Yeah, I'm good with however it works--for the price. I'm curious to play with it to see exactly how it functions. The 19cm dual-band antenna should also perform much better than the stock one, even tho that's a dual-bander as well (I'll probably use it on one of the colored units). I thought about going longer on the antenna, as they had some listed, but I didn't want it to be TOO long.
Now the wait is gonna kill me.

1598. frequency list cheat sheet

Yahoo group: UV-3R (2011)
Date: 2011-09-09 04:45:22 UTC
From: John Hogenmiller
Topic: 1598 Message: 1598

Hello,

I uploaded an xls and pdf file of MURS, FRS, and Marine VHF frequencies to the files section under frequency list. Basically, it associates common channels on other VHF bands with their actual frequency. The list is small enough that you can print it, cut it out, and then tape it to the battery backing of the UV-3R.

This is useful for those that might interact with a FRS radio or a licensed for GMRS or Marine frequencies. As always, if you aren't licensed for a frequency, don't Tx on it. But if you are, the UV-3R becomes a handy radio to use in multiple situations. In fact, I made this because one of the members in my club also participates in the Coast Guard Auxiliary. He liked the fact that the UV-3R covered his marine frequencies, but said he didn't have the 50 some channels memorised to their frequencies.

I do know that different manufacturers might use different channel numbers for FRS/GMRS frequencies, but I believe the set I found is the most commonly used. If someone has produced a GMRS only radio, channel "15" may be channel "1" and so on.

I've also thought it would be nice to tuck either this sheet or a version of the cheat sheet on the inside of the battery door. Need more information? Just remove the battery cover. Let me know if anyone has any suggestions for that.

Cheers,
John/Kb3dfz

19cm it's long enough if not you might want to get a telescopic one, they work really good. The 2 antennas that come with the old U3-VR work really good so I have a feeling that the dualband antenna will be just fine.

Yeah, I'm good with however it works--for the price. I'm curious to play with it to see exactly how it functions. The 19cm dual-band antenna should also perform much better than the stock one, even tho that's a dual-bander as well (I'll probably use it on one of the colored units). I thought about going longer on the antenna, as they had some listed, but I didn't want it to be TOO long.
Now the wait is gonna kill me.

Or buy the original Chinese version at a third the price of the Watson. I doubt that there is an antenna that outperforms the Nagoya NA-701 for the same money.

Actually, the PA MOSFETs can put out up to 6w but of course need more volts on them (6v to be precise). So it'd need a larger battery and parts of the circuitry toning down to 3.8v for other components, quite do-able really.

I just checked on this because I have an order from Chi Town on the way. It appears that if they ship it from HC by boat (Emma Maersk) she can make the trip in 4 days. (31knots) POE is probably California. Then it has to be transferred to USPS or other carrier to get to you. Mine was shipped on Sep. 5 so I feel it will be here next Friday or next Monday. I was told that it varies between 8 and 14 days transit.

Sounds like the software handles opening files well, but doesn't expect
the file to be handed to it on the command line, which is basically what
an associated file does when you double-click on it.

Oh, cool. I just went back to see what date the radios were shipped and I noticed they gave me tracking numbers. According to their directions, I entered the Hong Kong tracking numbers into the USPS.com site and they worked. Last entry was September 6 in Hong Kong, so I'm assuming they are on the boat now and haven't arrived in the US.
At least I'll be able to watch their progress toward me. :)
On a side note, this week I also purchased a Magnum 1012 handheld 10m/12m HF radio that I'm very much liking. I've been a 10m fan for years, but wish it was more open right now. Looks like a fun radio. With an easy modification, I should be able to get it on the CB band as well (for emergencies only--I don't hang out there).

My experience from a variety of these suppliers in China/Hong Kong has ranged from one to almost 3 weeks. Often takes 3-4 days to leave HK, 2-4 days in transit (virtually all are airmail.....not ocean), 1-3 days to clear customs then 2-3 days to reach me here in the Midwest. Toss in a weekend or two and there you have it. You should get a tracking number to monit or. Awaiting mine as well.

Hehe, you know it!
The thing is, I just got back into 2-meters this week. I haven't been on 2m for probably 15 years, until yesterday. I just got an older Alinco DJ-S11 yesterday (that was sold on eBay as "parts" because the guy didn't know how to test it--it works great and looks brand new). I then checked into a local 2m net, which I just found out about while checking the local 2m repeater frequencies.
And, come to think about it, I don't think I've ever used N7LN on 2-meters before and I've had this call since 1996. Weird!
Anyway, my local church organization is getting HAMs involved in emergency radio communications, primarily using 2m, so I'm getting back into it, hence the interest in the new radios. I'm trying to get more people in my neighborhood interested in getting a Tech license so they can get involved and I wanted to evaluate the UV-3R radios as a good entry-level radio for these people. (And heck, they sound pretty cool to me, too!) I think I have 3 new HAMs lined up to take a one-day class being taught on September 17. I hope the radios have come by them to show them off.
So, yes, I'm anxiously awaiting my new toys.

The advertisement states 99 channels plus 1 emergency channel. I wonder if this is going to be a new surprise for new owners that was not documented just yet or it is a pic of a beta. Have a look.
> If that is true, I wonder what else has been added? I think I am going to order one in the morning.
>
> 73 de W2EEC
>
> Eric

Hello Eric,

the picture in the auction above displays _all_ segments of the display in "service modus" probably, the channel number ist displayed with a "7 segment display", so you can display all numbers from 0 to 9 with an "8".

And so with an "188" you can display all numbers from 000 to 199, but only need to show 0-100 ;-)

Regards, Oliver

Remember that someone here said that the 1750 Hz-tone would be faulty than in louder areas, because the 1750 Hz-tone is generated outside by acoustic feedback... Search the group for this.

> Or buy the original Chinese version at a third the price of the Watson. I doubt that there is an antenna that outperforms the Nagoya NA-701 for the same money.

F'ack, I order the 701 with the transceiver, but I have an older 2-band Diamond here too, I will check out.

Or awake the HAM-spirit: Build yourself an optimised antenna for both bands:
Somebody post a PMR-mod, change the original antenna to a selfmade coax-cable-stick, probably a good way to build a good antenna for low money:
http://home.foni.net/~michaelbosch/projects/freecomm/freecomm.htm
(Start at "Aufbau der Lambda/4-Antenne " in german language, google translator helps ;-)

Other way: Cheap with an sma-connector or bnc, a 5o cm (lambda/4 or less) stick of welding-copper, insulated in the connector with nylon or fine gasoline-hose (i.e. from an scale plane), ready ;-)
Check out the best lenght for both most favourised frequencies (2m / 70cm)

Dual band antenna, which mine came with. Leather case next -- there are ones from the suppliers in China. The Lithium Ion battery lasts for a LONG time, so spare might not be needed. A car cigar lighter charger would be good, as I could run it off the car, or use one of my SLA gel cells in a pinch.

Frankly, what I want is a second one, in yellow...

I have two of the original single-display units on their way, but last night I ordered the new dual-display unit. I bought the package deal that has the extended 19cm antenna (it already comes with a standard dual-band antenna) and the soft case (dunno if it's leather or vinyl). I also bought a few extra options, including the USB programming cable, an extra battery, and the bnc converter, in case I want to use a "regular" antenna or connect to a mobile antenna.
I would definitely like a AAA or AA battery pack for emergencies and the car adapter would be nice.

For me, the first thing I'm planning to get is a dual-band antenna, a nice long one like Kennwood puts on their tri-banders. I could barely make it into a (VHF) repeater 8-10 miles away earlier tonight while trying to report about flooding in one area. It wasn't until I got 3 miles closer that others could hear me clearly.

The other thing that would be nice is a USB charging cable. I already have USB style chargers in my car and home, so connecting it to one of those would save me a wall-wart.

As a point of reference, I recently had to repair my IC-1ZA. I had to unsolder a connection to remove one of the boards. I originally stared at it for a while, then off an on for a couple days trying to figure out where the clip, nut, or screw was that I couldn't find. Finally, I managed to get ahold of a service manual and sure enough "unsolder point E". After that, I was able to remove the board and get to the antenna connection and repair the broken joint.

So for some radios, soldering is part of the assembly/disassembly process.

Tonight, I just modified my new Magnum 1012 HF handheld transceiver by unsoldering some jumpers. Earlier today, I bought an "unsoldering iron" at Radio Shack for about 12 bucks. It's a normal solderer, but the tip has a little hole in the middle that's attached to a suction bladder that allows you to suck the solder off the board and then blow it out into a waste container. It works rather--and I'm not that great an unsoldering.

Just another useful option.

There is a wire to SMA connector that definetly needs unsoldered.

Solder wick works if you are careful.

I ordered one of the leather cases. It is a very robust case and should provide good protection for the radio. But it is a very tight fit. It took quite a while to ease the UV-3R into it. If you only want to put the radio in the case when needed perhaps one of the soft cases would be a better idea.

The leather case does not have a separate belt strap you still have to use the flimsy belt clip. It does have a rather annoying neck strap though.

Julian, G4ILO

--- In UV-3R@yahoogroups.com, "W3FIS" <deadgoose38@...> wrote:
>
> Dual band antenna, which mine came with. Leather case next -- there are ones from the suppliers in China. The Lithium Ion battery lasts for a LONG time, so spare might not be needed. A car cigar lighter charger would be good, as I could run it off the car, or use one of my SLA gel cells in a pinch.

even if it's only 1050 the price is right and you can always put a claim with ebay. So I say go for it. They might be 1500 after all and again the price is right.

From: andyfoad@rocketmail.com
Topic: 1647 Message: 1647

Ok, so it's got dual display, dual frequency just like a Wouxun I think.

Presumably it's just switching the receiver between two frequencies,
just like the Wouxun's.

The Mk1 can do dual watch, same thing really, except you don't see
both selected frequencies at the same time.

Now then the big question is - dual display or not, the Mk1 CANNOT
do the dual watch from FROM MEMORIES!

So, will the Mk2 be able to select the dual rx from memories or not ?

Also, I have seen various packages on Ebay offering Mk2's with
optional extra's, such as programming cables, antenna, batteries and
cases.

BUT NONE WITH A SPEAKER MIC !

Where as the UV100/200's ARE being offered with speaker mic options.

Perhaps the Mk2's still have the rx audio output problem ?

I'm sure in a few weeks time we'll find out on here ;-)

Well I have two Mk1's here.

The rx output audio output via the speaker mic socket is too low to work properly, as noted many times on here.

> But there isn't a speaker mic for Mk1, is there?

No.

They don't bother selling them because of the known low audio
receiver audio output via the speaker mic socket.

Tx audio will work, but rx out is very low, making the speaker
part of a speaker mic pretty useless ;-)

The "R" has an internal oscillator at 26 MHz. Since it is an SDR, it runs the receiver with square waves, so you're hearing the 6th harmonic of 26 MHz.

By the way, the diagram published here mentions a 13 MHz oscillator, while I'm holding right now a UV-3R board with 26000 (kHz) oscillator right next to the RDA chip. I've also found a difference on VHF and UHF mosfets...

On that USB charging cable, I see that the supplied wall wart is 5v, 1000mA. A lot if not most USB ports are 500mA so you would need to make a dual plug cable like was common for early UBS ext HDs. One head was black and was the DATA and power and the other RED for the extra power.

Some computers from Appla and HP (maybe others?) have HIGH output USB ports but even some of them are 800mA and not 1000mA.

Now what is the size or part number for the power jack on the radio side?

Car Charger first then a USB charger next.
I can't tell you how many hours I spend in my truck and I also do some public service events. A car charger would be real helpful to me.
On second thought. A USB charger. Every place I go seems to have a computer with USB ports or have a USB to AC or a USB to DC converter around. I have a few from my other devices rollong around. Now that I think of it, I have a USB port on my new car radio that I have not installed yet. I wonder if that would work? Once I install the radio I have to see if I can charge other devices from it. That way there I could get rid of the adapters :-)

Yup. My vote would be a USB charger so I can use it anywhere I go.

Topic: 1647 Message: 1669

Wow. A Mk1 being offered with a speaker mic.

Odd thing is that the seller is another name for 409 shop, an
they have on their website the same mic as NOT being suitable
for a Mk1.

Well lets be factual here. Mk1's have a fault that means there's
a lack of receiver audio being sent through it. So nothing is
going to work properly anyway.

The question now is - have they fixed it on the Mk2 ?

Regards,

Andy

I ordered one too and compared it to the $30 Yaesu VX3 pleather case. It is functionally almost the same. I gave it to my daughter for her VX3 and it fits fine.

I measured the current while charging and it was about 450mA. I made up a USB charging cable and have used it several times with a regular USB port but mainly to keep the battery topped up.

Have you seen these adapters that plug in a car cigar lighter socket with one or two USB ports for charging or powering devices?

I thought I could use one of these in the cigar socket of my Diamond shack power supply to gain a couple of 5V outlets. I got one of the Griffin ones with two USB ports. Unfortunately the damn thing is a broadband RFI generator so the idea didn't work out. But in a car it wouldn't be a problem unless you do HF mobile.

Yes the wall charger is putting out approx 4v. The battery shows 3.3v this is after monitoring for almost 24 hrs. If I test the current flow to the radio with the charger in and testing the positive and negative in the radio it is not showing much voltage at all approx 0.3v.
This was all working fine last charge which was one day past.

This was a great post! I stopped by Rat Shack this morning and scored the battery. It's an 1.1 ah vs the stock 1.5, but it was cheap.

Cheaper than what Leigh said.

How cheap?

$1.97 plus tax. Total came to $2.10. Gave the store manager $3 and he handed me my $1 bill back... so out the door for $2.

... and no, that was the last one in the store.

For others... you're looking for an UntraLast battery. My receipt shows part # 2300485.

Fit into the radio is perfect. The battery was fully discharged when purchased, probably because it sat around on the shelf for such a long time. It's charging (in the radio) now.

Go get em, folks! And thanks Leigh!

1698. Re: Reccomed a dual band antenna

Yahoo group: UV-3R (2011)
Date: 2011-09-10 19:00:30 UTC
From: W3FIS
Topic: 1686 Message: 1698

I have been using a "no name" SMA based wire 1/4 wave whip that I picked up at a Ham Fest. I also have used the Diamond SRH77CA, which I got from Universal Radio. The Diamond works fine (I also have the BNC version for some other HTs and my FT-817ND), but it is a little heavy/bulky IMHO for the Baofeng's size. Better suited to my FT-60R. The Diamond's base is large enough to make good contact and a seal with the rubber/vinyl washer on the Baofeng.

I'm talking about sensible ones here..(for the price)...

- Auto power off

- Ring bell (when a certain DCS/CTCSS is detected)

- Clock

- Auto CTCSS/DCS detect

- Decent dualband antenna
- Battery case

And some featrures that wouldn't be that hard to implement:
Frequency naming
Much faster scan speed
Some sort of banking
More memories.

Can't speak for the TG-UV2 but the original TG-UV is certainly not crap.
It's only real failing was the price at the time of introduction and the
fact that it did not have alpha tagging or DTMF. I see that the TG-UV2
has alpha tagging.

I got a pre-release TG-UV from the factory back in 2008 and it has good
specs and good build quality, like all Quansheng products I have
encountered. Sadly, it got left in the wake of devices like the Wouxun
in the race to include more features.

From: David Singleton
Topic: 1064 Message: 1708

It is not bad, but I would buy the Wouxun instead, it is better. The Quansheng seems to be a copy, but one of the weirdest things was that although the LCD displays two lines, only one the top line will display the channel name, while the bottom line will display the frequency, kinda weird if you ask me. For example

On the Wouxun my display would look like this
TCSO1
TCSO2

while the same set of frequencies on the Quansheng would look like this
TCSO1
453.650

The wouxun is a good little radio, you can grab one on ebay for about $110

From: g4ilo
Topic: 1711 Message: 1712

From the schematic it looks like the UV-3R has separate PAs for VHF and UHF. So perhaps the VHF PA has failed. Can you hear any output at all on VHF (e.g. with another radio placed near it?)

Date: 2011-09-11 08:09:23 UTC
From: andyfoad@rocketmail.com
Topic: 1064 Message: 1713

A local amateur has purchased one of these recently and I worked him on it.

The tx audio was very poor, but he improved it by enlarging the hole and taking away some packaging around the microphone.

In the end the tx audio was perfectly acceptable, but does require the operator to still speak very close to the microphone.

But as I said, in the end the tx audio was quite good.

He has not complained about the receiver, that seems ok.

But the phone screen when it's illuminated seems to produce some RF noise affecting weaker signals.

The cellphone part of it seems to be perfectly ok in all respects.

It's not a perfect product, but it's unique and quite useable in the end.

It's not like there's no choice.

I almost bought one myself, but with gazzillions of HT's already at my disposal and a perfectly good cellphone (Nokia E90 Communicator) having such an item would be a bit of a downgrade for me ;)

1714. UV-3R Mod: Doing the mods with standard equipment

Yahoo group: UV-3R (2011)
Date: 2011-09-11 09:59:56 UTC
From: zirbitzkogel10
Topic: 1714 Message: 1714

Hello there,

for those, who want to do the important mods, but are afraid of using SMD technology (or don't have the SMD resistors handy): I did the bandpass and the audio output modification with standard equipment (non SMD). I loaded two pictures of the result to the photo UV-3R Mod album. And yes, it is working! All you need is a sharp soldering iron and a little patience.

One suggestion: Be careful that the resistor for the audio mod is not too close to the end of the circuitboard - otherwise it may touch the housing. This happend to me - in that case you get a really quiet audio output: totally quiet ... I used a 33k resistor in parallel with the existing 100k - so a total resistance of app. 25 k can be achieved. The audio is very nice now.

Good luck!

Zirbitzkogel10

1720. Out in the real world

Yahoo group: UV-3R (2011)
Date: 2011-09-11 12:16:11 UTC
From: walscobry
Topic: 1720 Message: 1720

Well I got to take the little UV-3R out in the real world yesterday and the results were not good.

Repeaters that I could get on lowest power setting of my VX-8R could not be reached with the UV-3R on high power at all.

Tried more than 1 antenna and the VX-8R worked fine with dual bander that came with the UV-3R but the stock VX-8 antenna and a smiley 270A did nothing to help the UV-3R.

Major picket fencing while walking while in direct LOS of repeater tower 2-3 miles away.

Being near any other 2m radio causes it to go silent on RX and TX.

Talking simplex to nearby radios (10 to 100 feet) results in no RX audio, radio opens RX light comes on but no audio. Getting way overloaded on the front end?

When its does RX it is *insanely* loud on the lowest audio setting.

It does get good audio reports when you can hear them give it to you. Maybe it is a 1 way radio? er, not funny.

I had ZERO success in using the 440 band via repeaters or simplex. Tests ranging from 10 feet to 2-3 miles.

Other odd behaviors like FM radio switching back to 2m all by itself. Not using the DW function BTW.

Bottom line it was not usable even in very favorable conditions.

Very disappointed, I've had much better performance from a 300mw HTX-400!

Well, I do get somewhat different results. The stock antenna doesn't cut it for 2 meters, but works fine on 70 cm. I've tried two different aftermarket antennas - Diamond and "no name" 1/4 wave whip, both of which work well on 2 meters and 70 cm. I got mine 2 weeks ago from wouxun.us, and it appears to be the most current version, FWIIW.

With an external J pole in my attic, up 14 feet, I have no problems hitting our local repeaters for net operation.

The difference between 2 watts and 5 from my Wouxuns and Yaesu FT-60R is minimal under comparable cirucumstances/antennas.

I think some Icom's have it, and my VX7R has one.

These days I think HT's need to be a bit more utilitarian.

Packing a basic rig on a trip is ok, but when it has a few more
simple features on it you are more likely to want to pack it.

I like my VX7R with it's clock, and power ON timer.

So I can leave it pretuned to a broadcast station and set it to
wake me up at a certain time.

Simple features, but useful.

mega409 shop has the A3SM-UV, they also sell them as a package with the baofeng.

I use it on my baofeng and it performs much better on 70cm than the original antenna.

From: yrlesdude
Topic: 1720 Message: 1726

My results seem a little different as well...

On simplex at both bands, the UV-3R @2W and my KG-UVD1 @5W with stock antenna perform comparably. So far I have found no instance where the UVD1 can talk into the UV-3R but not the other way around.

On repeater; however, the UV-3R transmits into a repeater about 13km away with S3-S4 quality. The UVD1 cannot get audio in, only enough to key the repeater.

At home, I can hear traffic from repeaters 40km away with the UV-3R, sometimes enough to even key it. The UVD1 just sits there sounding static with the squelch set wide open.

I can also RX NOAA weather from Allentown PA (S2-S3) and Poughkeepsie NY (S3-S4), both about 100km away. The KG-UVD1 only produces static there too. UV-3R leads similarly in FM Broadcast RX too.

WRT ruggedness, the KG-UVD1 survived several drops to concrete floor with hardly a ding, as expected. The UV-3R also took a few drops to concrete floor (once completely shearing off the plastic lanyard clip) and survived them too. I think that the lighter weight of the unit offsets the flimsily-built case.

I only keep the KG-UVD1 around because it has alpha tags, extended high band coverage and wide audio volume range. If the UV-3R had those three features (the single chip SDR supports to 500MHz), I would probably give up the UVD1.

Not sure if it helps, but I got tired of switching antennas and bought a NA-666 (Diamond clone) for $10 on ebay, so the UV-3R is a keeper for me.

Absolutely without a doubt Skip on Scan! Otherwise the scan is useless, or the 99 memories are useless, or it is useless for any frequency that you might not want to scan(wx). Without that this is relegated to the glove compartment after a few days of playing around. I cannot stress enough how important this feature is. I have a 30 year old handheld that has this feature.

1) three watts
2) come standard with dual band antenna which people would replace anyway
3) band scope
4) band edge scanner, so if you need to search for frequencies in your area then it will find them and dump them inot memory.
5) stereo phone jack
6) ability to receive 10/11 meters AM 25mhz to 30 mhz.
7) I agree a clock would be awesome and true!

Here are the top-ten things I want on my UV-3R:
1. Have an alarm to wake me up in the morning.2. Run iPhone apps.3. Get me on the Internet.4. Make me breakfast in the morning.5. Open the trunk of my car.6. Work as a credit card at my local gas station.7. Mow my lawn.8. Spit $100 bills out of the battery compartment.9. Prevent me from getting old.10. Give me a free pass to heaven.
If I can't have those, I guess clear rx and readable tx on 144/440 would be good. I haven't gotten mine yet, though, so maybe I'll already get those.

And how much more would you be willing to pay?
This is a $35ish retail radio.
All items on the wish list would require a bigger battery, a bigger
radio and more $$

Not so fast Julian!
I have just (almost) fixed a non working VHF RX chain. It is separate from UHF as well, like the TX chain. I was /worried/ about the RF amplifier. I opened it up and I was getting signals through simply by pressing the PCB. Even bending lightly the PCB fixed the problem.

Either a cold solder joint or a broken trace.

I gently pushed (with a plastic tool) all components until I found that either Q9 or Q11 have a cold solder joint! That's not RF, but rather voltage switching transistors! Even easier (and less static-sensitive devices involved) I'll write a blog post soon about this, with pictures.

I will also include some component details on pictures so that they can be cross-traced with the diagram.

For Michel, as someone had pointed out to me, the board layout is pretty close to the way the schematic diagram has been drawn. For the TX RF chain it certainly is.

Hope this helps to get you on the right track.

I have NO trouble checking into our Tuesday evening net while walking the dog with the UV-3R on 2 meters IF I use a 1/4 wave whip. The repeater is about 20 miles away.

With my Wouxun or Yaesu FT=60R at 5 watts, same story. I need the better antenna.

The issue is the antenna, NOT the HT. However, 70 cm seems to be a different story. Stock antenna works fine, EXCEPT on our club repeater's 70 cm unit, again, 20+ miles away.

Remember that we are using FM, so either we quiet the repeater or not. As to receive sensitivity, all my HTs can often hear things I can't talk to, or barely "kerchunk" the repeater if I am at a marginal difference.

Using my base station J pole and an SMA to UHF jumper, there is NO noticeable difference in performance with the Baeofeng versus any of my 5 watt HTs or my Yaesu FT-817ND.

Next project is to program the Baeofeng for some of the splits for SO-50 and AO-27 satellites and see how it works. The published specs on the receiver for the Baofeng is at least as good as the Wouxun, which is my most sensitive HT.

When I get a few pennies ahead, I'm going to get a Yellow Beofeng... and the car charger.

I haven't tried the Baefeng in the car with an outside whip. I have the side window clip from MFJ that fits a BNC whip. I've used that successfully for an "XYL approved" mobile rig.

Why don't you simply say here, that it's the U/V key to hold instead of
the F/A? Why should others watch a stupid video, which shows nothing
else than moving text?

So for all who want to know:
For the 18-menu UV-3R hold key U/V while turning the rig on will reset
it to the factory defaults.

The UV-3R original UHF antenna works really good. In fact it does a better job on VHF than the VX-3R dual band antenna. The new UV-3R Mark II comes with a dual band antenna, I will post a review as soon as I get the radio.

Subject: [UV-3R] Re: Out in the real world

I have NO trouble checking into our Tuesday evening net while walking the dog with the UV-3R on 2 meters IF I use a 1/4 wave whip. The repeater is about 20 miles away.

With my Wouxun or Yaesu FT=60R at 5 watts, same story. I need the better antenna.

The issue is the antenna, NOT the HT. However, 70 cm seems to be a different story. Stock antenna works fine, EXCEPT on our club repeater's 70 cm unit, again, 20+ miles away.

Remember that we are using FM, so either we quiet the repeater or not. As to receive sensitivity, all my HTs can often hear things I can't talk to, or barely "kerchunk" the repeater if I am at a marginal difference.

Using my base station J pole and an SMA to UHF jumper, there is NO noticeable difference in performance with the Baeofeng versus any of my 5 watt HTs or my Yaesu FT-817ND.

Next project is to program the Baeofeng for some of the splits for SO-50 and AO-27 satellites and see how it works. The published specs on the receiver for the Baofeng is at least as good as the Wouxun, which is my most sensitive HT.

When I get a few pennies ahead, I'm going to get a Yellow Beofeng... and the car charger.

I haven't tried the Baefeng in the car with an outside whip. I have the side window clip from MFJ that fits a BNC whip. I've used that successfully for an "XYL approved" mobile rig.

From: nochswl
Topic: 1752 Message: 1752

Hey all,

someone has written an manual in german language,
http://www.ebay.de/itm/110739867103
did anybody knows the guy or a place to download it?

For german groupmembers:
Has someone here translatet the manual in german language (already)?

Did anybody will have a german-languaged manual?

Can anybody tell me how I can edit the original english pdf-manual?
I need help to open the source:
http://www.difona.de/pdf_en/bfuv3r_manual.pdf (6.67 MB)
http://www.fleetwooddp.com/digital/index.php?main_page=page&id=15 (4.16 MB)

Press and HOLD the lamp/FM switch bottom left side below PTT.switch. Radio enters FM mode and FM appears in display on left side. FM Broadcast reception is interrupted and radio reverts to selected Ham frequency when a signal is received. Then switches back to FM after HAM signal ends. To exit the FM band, press and HOLD lamp button until FM disappears from front display. The radio should now be on the appropriate Amateur freq. This is made quite clear in the manual if translated from Chinglish. ;-)

Because the video shows/tells how to do it correctly and the users guide is wrong so as to find another media to view instead of a wrong manual, he made a user friendly and correct video to watch instead of typing it here. It makes it easier for anybody 'n' everybody. What you should be concerned about is the "stupid" manual that has it ALL WRONG!!

Generally the Adobe PDF reader has a feature to "save as text." Of course, you will have to do some serious editing. The later part on "advanced use" will be all that is really needed, along with the excellent "cheat sheet."

All things considered, the Baofeng is still one of the easiest radios I've ever had from a programming viewpoint.

If you want a "bear," try the Yaesu FT-817ND. Many too many options and features... Simple is GOOD!

BTW, has ANYBODY yet figured out the "Emergency Channel" feature??

Thanks Paul,
I just have found out that there is no genuine pdf, it's only just a scan of the printed manual (expl. *.jpg) and saved as an pdf...

Editing will be very difficile...

But you're right, if somebody reads the manual and the 18 menu quick reference with awake brain, than the radio explained itself.

But -I wonder- why does someone ask here _before_ reading the f.....g manual??

Therefore I thought to find a translated manual, the french is avaiable in the "files" section already.

Exchange it.

My friend and I work exclusively on 70 CM. Excellent results with provided rubber duck on repeaters 20-35 miles away in the NY-NJ area. If I can hear it I can work it, so far thats 29 machines, expect that many more. After working exclusively with Yaesu on VHF/UHF, we are extremely pleased with ease of operation and audio from such a small device. In noisy mobile the loud audio is appreciated. At home the included headset tames the problem. Best low buck purchase ever made has kept me smiling for weeks now. I find myself on the air more often now.
When I first got it I was asking for signal and got few replies, joining QSOs was more successful. UHF is amazing around here, like using a cell phone.

Subject: [UV-3R] Out in the real world

Well I got to take the little UV-3R out in the real world yesterday and the results were not good.

Repeaters that I could get on lowest power setting of my VX-8R could not be reached with the UV-3R on high power at all.

Tried more than 1 antenna and the VX-8R worked fine with dual bander that came with the UV-3R but the stock VX-8 antenna and a smiley 270A did nothing to help the UV-3R.

Major picket fencing while walking while in direct LOS of repeater tower 2-3 miles away.

Being near any other 2m radio causes it to go silent on RX and TX.

Talking simplex to nearby radios (10 to 100 feet) results in no RX audio, radio opens RX light comes on but no audio. Getting way overloaded on the front end?

When its does RX it is *insanely* loud on the lowest audio setting.

It does get good audio reports when you can hear them give it to you. Maybe it is a 1 way radio? er, not funny.

I had ZERO success in using the 440 band via repeaters or simplex. Tests ranging from 10 feet to 2-3 miles.

Other odd behaviors like FM radio switching back to 2m all by itself. Not using the DW function BTW.

Bottom line it was not usable even in very favorable conditions.

Very disappointed, I've had much better performance from a 300mw HTX-400!

I find that I have to read the manual through at LEAST a couple of times, and with a orange highlight marker in hand for some of the more obscure items. There are a couple of errors, such as the general reset issue, but that has been cleared up.

I've written manuals and actually gotten paid for it in a prior life. For someone whose native language is not English, writing/translating a manual can be difficult. I had a number of Vietnamese students, and they said English was a very difficult language for them.

Topic: 1680 Message: 1773

Darn right about that, Roberto! ;) I'm going insane!
I checked my tracking numbers again this morning. No update. My two single-line display units (one blue, one red) were purchased and shipped September 3. The last entry was from Hong Kong in the sort facility on September 6. So apparently they took 3 days to get out of Hong Kong, but they have not arrived (or not been scanned) yet in the U.S.
My dual-line unit was purchased September 8 and I just got notice this morning that it was shipped today. No information is available yet for the tracker number. Looks like that one took longer to get out the door.
So, I'm still anxiously waiting and probably will be for maybe a week. Probably at least two for the dual-line unit.
On a bright note, though, my 16-year-old son signed up for a class for the Technician class license on this Saturday. I've been trying to get him interested over the past couple of months. The local testers are offering a one-day, all-day-long course to teach the Tech class and then administer the test at the end of the day. I told him if he passed the test, I'd get him a radio. If he passes, he'll probably get the blue one.
And, my wife has had a Tech license for about 15 years, but never got on the radio. She did it mostly out of support for me. On Saturday, I got her to help me test my new 2-meter base station, so she talked on a small Alinco 2-meter handheld I recently acquired. That was her first time on the air using her call sign, but it was just on simplex with me. That's a step, though.
So, things are happening at the N7LN home. :-)

Subject: Re: [UV-3R] Re: If you could add new features, what would it be ?

Here are the top-ten things I want on my UV-3R:

1. Have an alarm to wake me up in the morning.
2. Run iPhone apps.
3. Get me on the Internet.
4. Make me breakfast in the morning.
5. Open the trunk of my car.
6. Work as a credit card at my local gas station.
7. Mow my lawn.

8. Spit $100 bills out of the battery compartment.
9. Prevent me from getting old.
10. Give me a free pass to heaven.

If I can't have those, I guess clear rx and readable tx on 144/440 would be good. I haven't gotten mine yet, though, so maybe I'll already get those.

1) three watts
2) come standard with dual band antenna which people would replace anyway
3) band scope
4) band edge scanner, so if you need to search for frequencies in your area then it will find them and dump them inot memory.
5) stereo phone jack
6) ability to receive 10/11 meters AM 25mhz to 30 mhz.
7) I agree a clock would be awesome and true!

From: W3FIS
Topic: 1716 Message: 1775

Even more interesting is that a few things are apparently un-documented. I find that while scanning, if I rotate the control knob counter clockwise, that the scan direction changes on the fly. The lack of clear explanation of the RELAY feature, and the error about general reset have been my only serious problems with the manual.

We saw the same problems years back with early Japanese stuff. Sometimes stuff coming out of Taiwan has problems.

1776. Re: [UV-3R] New poll for UV-3R

Yahoo group: UV-3R (2011)
Date: 2011-09-12 15:29:53 UTC
From: Darvell Hunt (N7LN)
Topic: 705 Message: 1776

That's an interesting question, but I voted NO. There are many, many older handheld HAM units available nowadays and noobies could just as well get one of those as the new UV-3R's. Most of these older radios are probably even easier to learn to use, since they are older technology.
As an example, just last week, I received an Alinco DJ-S11 2-meter handheld that I purchased on eBay for $46. It's a great little radio with an telescoping antenna and I've already gotten great reports on it on the local repeater, and it runs only 1/3rd of a watt.
So, I think there's always that possibility, but I don't think the UV-3R makes it worse. If anything, it will help new HAMs get on the air, because they can afford a cheap NEW radio, and they will learn about being on the air, instead of having a license, but never getting on the air.
There's always a learning curve for new people and I think that us OM's (or OW's) can deal with that just fine. HAM radio has always been like that and learning new things is part of the fun.

Just my opinion, of course.

Enter your vote today! A new poll has been created for the

UV-3R group:

Is the UV-3R a curse to Amateur Radio

Being so cheap and easy to obtain means anyone can buy one for the wrong reasons and

basically make a nuisance of themselves on air?

Do you think its a curse?

o Yes

o No

o Have to wait and see

To vote, please visit the following web page:

http://groups.yahoo.com/group/UV-3R/surveys?id=2696562

Note: Please do not reply to this message. Poll votes are

not collected via email. To vote, you must go to the Yahoo! Groups

web site listed above.

Thanks!

I think a great number of people like the youtube videos for learning stuff. My wife knits a great deal, and the youtube stuff shows exactly how to perform complicated tasks.

I also use the youtube videos when checking out potential new equipment purchases. Useful to see how things really work, which you can't often easily get from a written discussion.

Unfortunately as with many other Yahoogroups, the lunatics are taking over the assylum!

Don't know how or can't be ar$ed to search for the answer to a question which has been answered dozens of times already...

Don't know how or can't be ar$ed to delete the original message meaning a one line post can stretch to epic proportions...

Grumble because a $35 radio doesn't perform like/have the features of a $400 radio...

I would love to have the time to be a moderator on this group, even though I would no doubt upset a lot of people, but I have my own group, website and forum to manage.

Well I've put in a join request for the new group.

On the other hand I *personally* think that there should be one group to deal with the both Mk1's and Mk2's.

It's easier to find all information in one place.

I've seen the split with the Alinco G7E and G7T and the splitting of groups has not exactly produced any tangible benefit.

Just my own thoughts, but that may change depending up if the Mk2 is radically different from the Mk1.

Regards,

Andy

One thing that does annoy me is when these groups become infested with debates ad infinitum about FCC approvals.

There's the rest of the world to consider, and the rest of the world doesn't care about FCC approvals.

The rest of the world has a sensible approach, use what you want within the terms of your licence.

At least this group has not been down that road - thankfully.

Let's just enjoy our rigs, make QSO's, make friends, share knowledge and progress with it.

73 to all,

Andy

1785. Some info received about the Mark 2.

From: andyfoad@rocketmail.com
Topic: 1785 Message: 1785

Got an email today from 409 shop.

I asked about whether the Mark 2 is able to do dual receive FROM
the memories (Mk1 cannot, you have to dual watch in VFO mode only).

Apparently you can (hooray).

The cycle between the frequencies is apparently every 5 seconds.

Also you can do VV/UU/UV modes too.

The Mark 1 cannot, it can only switch between a VHF and a UHF frequency.

Hope that makes sense ;-)

In case you want to switch to blue LEDs you should even look for a 33R
0603 R48 instead of the stock 47R to match it to the slightly higher
forward voltage of blue LEDs.

Thanks.

However I am not a fan of the blue colour on radio displays,
it makes it too difficult for me to read. (Same on the FT817).

For me green is always best ;-)

That's true here. I don't know why people insist that equipment must have part 90 approval, We operate under part 97. All we really need is part 15 certification if it can receive out of band. Even then, homebrew equipment needs no approval or certification to operate. You just have to be sure you're operating withing your license. Not only frequency wise but emissions also.

Hey Paul, goood idea,

I just found out some undoc functions on my pmr walkie-talkies, most of them becomes explored if you push any button while unit switching on.

Just try with any knob ;-)

BTW: A radioscanner Uniden Bearcat BC 70 XLT (AFAIK) comes back after service with an other frequency range (>1995), if I have had known the tricks with "pushing knobs while switching on" I've never send it back and get lose in the ether of german postal service... :-(

Yeah, but we have to pay attention, possible any function changes and we will not find out the way back... maybee

Buit: I'm still expect my radio, sent from HK at 29.09., but already not here *argh*

>
> 73 /paul W3FIS

German language is more difficult ;-)

But -I wonder- if you live in a land where the _guests_ has more rights as the native citizens they ask for any official librairies in theyr language!!

For example: For the driver license they have RIGHT for questionnaire papers in THEYR language, english, italian, arabian and so on.

So the asylum seekers could make theyr license here in theyr language without knowledge of the language where they life.
Foolish world...

For textmarker-notes I use a copy of the manual or the download, tho original I never paint or write in.

Personally I think that the UV-3R manual is one of the better ones that I've seen coming out of the orient.
The worlds worst truly has to be this one for a portable LCD TV

http://www.raspberrycrafts.co.uk/worldsworst/

It is completely meaningless.

We do a lot of stuff in Spanish, as about 25% of our population is Spanish speaking. In Canada, they do French and English.
>

> For textmarker-notes I use a copy of the manual or the download, tho original I never paint or write in.

I try to get as much of my documentation in PDF format as I can. I then load it on my computer. Look into a program called "Calibre," which is a nice organizer for that sort of thing.

So, is there an English translation as well? LOL.
If not, it might be helpful for somebody to translate it from Engrish into REAL English, and add a few corrections where the manual is wrong.

Not a total answer, when a frequency that I want to keep becomes a nuisance I switch the RX to the first DCS code and it skips that channel in the scan. You can do a similar setup for scan groups. Kind of labor intensive but It keeps weak stations from interrupting scans.

I am sure we will find lots of tricks.

1805. Writing a FAQ: contributions welcome

Yahoo group: UV-3R (2011)
Date: 2011-09-13 08:52:34 UTC
From: Paolo Cravero
Topic: 1805 Message: 1805

Good morning all.
I have collected few Frequently Asked Questions in an online document.
The document has been left open for editing to anyone willing to
contribute with answers and/or questions+answers (do not ask on the
FAQ).

At the following address you can edit the document:
<https://docs.google.com/document/d/1-6qmDIGSLrh6mhhAVpjTrJYO4loQzxQq8fv4AGp9SI0/edit?hl=en_US>
You only need a browser. No authentication required.

Read the rules in the first page and contribute. Do not erase text. If
it is wrong, correct it, add comments or use highlighting.

This FAQ is for UV-3R, not the mark2 just yet.

Once the FAQ document becomes complete it will be uploaded in the Files section.
Then the Group owner/moderator will have the choice to link it on the
group homepage and add the link to the automatic signature.

From: W3FIS
Topic: 1806 Message: 1808

For mobile use, I have the MFJ window clip.

http://www.rffun.com/catalog/hamantht/3757.html

I have the BNC version, so use a "no name" 1/4 wave BNC base whip. You need the BNC/SMA adapter, of course. HT drops in the cup holder. The mag mounts work fine, but they tend to mess up the finish on your car.

For base use, I built a copper tubing J pole. Like so:

http://www.eham.net/articles/2418

I put a 1/2" Cu to pipe adapter on the bottom. Screwed a 1/2" flange to the floor. I can easily unscrew the antenna for service, etc. I get about the same excellent SWR as shown in the article. I also use the antenna on 70 cm.

See the brochure (link below) and see that you can order the radio with and brand name, expl. your own:
http://www.verotelecom.com/brochure/UV-3R.pdf

And for an other manufacturer see name and the address in the last page of the manual, "fujian nan'an baofeng electronics co., ltd"
http://www.powerphone.com.cn (chinese)
Manual download here:
http://www.difona.de/pdf_en/bfuv3r_manual.pdf

Also with reset-error and fm-radio-switch (push on/off)

Yeah, thanks, Lynn. I did read that when you sent it, and that's my experience as well, but that didn't quite answer my question.
I'm wondering if I'm going to see ANYTHING on the tracking site before it gets delivered. I mean, could it be delivered TODAY? Will I get ANY advance notice, or is the tracking number practically useless?
Also, the bummer deal is that they'll probably make me sign for it and I'm not home while I'm at work. So even if it DOES come, I'll probably still have to wait another day to pick it up at the post office. Yay.

Thanks,Darvell

How long for shipping? How long did the merchant say. Too many variables, inventory, weather, surface or air, etc. As for the "tracking number" from USPS, forget it!!!!!!!!!! It is only a "DELIVERY CONFIRMATION". Multiple posts to this group won't get it here any sooner. ;-) Download the manual and read up on the radio, read the posts on this group and find out the answers to many common questions It will lighten the moderators load.

Still no change on the USPS site with the tracking number. Is it possible USPS won't update the status until it's delivered? Or will it likely get scanned when it arrives in the U.S. or my local PO?
Just frustrating watching the tracking number do NOTHING day after day. Maybe they shouldn't have sent me the number. LOL.

It isn't 100% consistent, but I usually see a few status updates as packages make their way to me. In particular, I usually see a status of "Processed through Sort Facility" when it gets to the US (the facility varies, but it's listed). I've also sometimes seen a status of "Inbound out of customs." The final status and the one that signals imminent arrival is "Arrival at Unit". If the unit arrival is early enough in the day, it usually means I'll be getting the package that day.

The most annoying thing about these shipments is that they often sit in China for days before moving (with statuses of "Acceptance" or "Origin Post is Preparing Shipment"). I have a UV-3R Mark II that the eBay seller marked as shipped on the 9th but that didn't show up until yesterday (it's current in "Acceptance" status).

Generally, for me, shipments from China usually arrives within two weeks.

The worst I'd ever seen, though, was last November when China Post accidentally 'lost' a bunch of packages for two months. They sat in '... Preparing Shipment' status for the whole time until they finally found them. I only found out what happened by accident on the DealExtreme forums, when one of their CS reps started a thread to explain and apologize for the delay.

Excellent idea, Les! Only problem with that is that I ordered two colored ones (red and blue) and the new dual-line Mark II. I don't see any of those at Wouxun.us. Besides, even though I'm impatient, I hate paying extra to receive something faster. But, then again, it's only $15, so maybe it's worth it.

In my experiences with USPS, you won't see anything, nor have any warning, before the package arrives in your mailbox. Sometime AFTER the delivery, the tracking status will be updated. USPS tracking helps the shipper, not the receiver, IMHO.

Well it only took two days and besides that if there is a problem with it Ed will take care of it and you won't have to ship it back to Hong Kong. So far 3 Wouxuns and 2 Baofengs from him all have been great. Customer service is worth the $15 to me. But then again that's just me.

> Darvell (N7LN)

I don't know what's "REAL english", i have had 2-3 years english (oxford) lesson in school, than a girlfriend was in the "Independent Baptist Church" and invite me to visit the sunday-school, later than I drove a few years taxi ans improve my (US)english with some US army-soldiers and airforce-mae from the bases in and around Wiesbaden (yeah, my city of birth).

Some people told my I could speek good english, of coure I like to improve it every time, see here in the group. I mean knowing english ist today very very important, you can communicate with every people round the world, not only ham-radio. OMHO.

And - if I get my wanted informations not in germany, so I look out for english written datas, eqal ham-radio, mountainboarding, kite-flying oder digital photography. The american discussion-groups are often more informative than the german boards.

Regards, Oliver

The lack of clear explanation of the RELAY feature, and the error about general reset have been my only serious problems with the manual.
>
> We saw the same problems years back with early Japanese stuff. Sometimes stuff coming out of Taiwan has problems.
>
> /paul W3FIS

Hello Paul,
the direction of scanning ist in the manual, buir the reset ist wrong.

Also the function to activate fm radio: "press on/off long" huh??

Please see this version of manual:
http://www.difona.de/pdf_en/bfuv3r_manual.pdf

I've printed it out, read it today in my truck and compare it with the here: Some fact are wrong.

Maybe someone cold copy the WRONG facts in the FAQ and put the RIGHT facts byneath, so anybody can correct his own manual.

1830. Angry with mega409shop about shipping...

Yahoo group: UV-3R (2011)
Date: 2011-09-13 19:42:17 UTC
From: nochswl
Topic: 1830 Message: 1830

Hello all,

I'm very angry with mega409shop...

At 16th August I order one UV-3R with 18 menu for US$ 34,00 plus US$ 11,00 P&P,
with a separate order I ordered 3 SMA-BNC adaptors, 2 SMA-SO239 adaptors and 1 NA-701 Antenna.
The price for the parts is US$ 31,50 plus US$ 13,50 for shipping.

So well, I ordered in separate orders because I don't believe in the postal service (might become stolen) and for the customs authorities the price for one parcel have to be LOW (<22,00 EUR, ~30 US$), than the customs authorities don't check the parcels.

Bur what do the dumb 409ers??
The pack all in one parcel, cashes the whole shipping fee (for 4 parcels) and now the customs authorities are very interested of the content of the parcel.
Not afraid of the transmitters inside, but now the price for the content I have to declare is US$ 80,00 and the tax-free limit is exceeded.... :-(

Sh*t!!

So I want to notice y'all (german costomer primary) to order in small partitions every 2-3 weeks: You can minimise the risk of loss and the risk of paying to much tax.

Note: The german rules of tax said: No tax for ham-radios and ham-stuff, but 19% VAT.
LESS than 22,00 EUR they don't be interrested on it, if it's more than they could be interrested on it.

I hope (so far god helps) the don't check my ham-license (I'm just in preparation for it), the property of transmitters is not prohibited, onlx the using, but I don't know how far the authority personal knows that...

However, I payed for 4 parcels but I only get one, thats angry.
I think to give a "special" rating for it.

Maybee this helps somebody.

Uh, sorry,

I don't have any better pictures. I would have to open the device again...

But I can try to explain:

For the audio mod the 33k resistor is directly soldered to the pins on the right hand side of the integrated circuit (looking at the device in front of you where the led and the knop are pointing away from you). I did the soldering like this: I took the resistor and placed it directly on the board. I cut off the conneting wires of the resistor to the right length - After that I put some solder on the resistor's connections and some solder onto the two pins of the integrated circuit (only few solder!). I then placed the resistor directly to the pins of the IC and soldered the resistor's connections to the pins of the IC. This is "relatively" easy, because the pins of the IC are those farest out to the right (pin number 4 and 5).

For the bandpass mod the capacitor is soldered directly to the one end of the inductor. The other connection is soldered to the ground nearby. Be warned, the groundpad is relatively large and needs to be heated up thoroughly - I had to use a temperature of 450 degrees Celsius (the transfer of heat with a small soldering iron is not too good)

Good look!

I loaded two pictures of the result to the photo UV-3R Mod album. And yes, it is working! All you need is a sharp soldering iron and a little patience.
> >
> > One suggestion: Be careful that the resistor for the audio mod is not too close to the end of the circuitboard - otherwise it may touch the housing. This happend to me - in that case you get a really quiet audio output: totally quiet ... I used a 33k resistor in parallel with the existing 100k - so a total resistance of app. 25 k can be achieved. The audio is very nice now.

Have you tried keying the tracking number into the Hong Kong Post website? That will give you an idea if the item has left HK or if it is still going through the HK postal system.

Orders from HK to Vancouver Canada typically take 2, 2.5 weeks, with one of those weeks being the item sitting at Canadian customs.

Hello all,

I'm very angry with mega409shop...

At 16th August I order one UV-3R with 18 menu for US$ 34,00 plus US$ 11,00 P&P,

with a separate order I ordered 3 SMA-BNC adaptors, 2 SMA-SO239 adaptors and 1 NA-701 Antenna.

The price for the parts is US$ 31,50 plus US$ 13,50 for shipping.

So well, I ordered in separate orders because I don't believe in the postal service (might become stolen) and for the customs authorities the price for one parcel have to be LOW (<22,00 EUR, ~30 US$), than the customs authorities don't check the parcels.

Bur what do the dumb 409ers??

The pack all in one parcel, cashes the whole shipping fee (for 4 parcels) and now the customs authorities are very interested of the content of the parcel.

Not afraid of the transmitters inside, but now the price for the content I have to declare is US$ 80,00 and the tax-free limit is exceeded.... :-(

Sh*t!!

So I want to notice y'all (german costomer primary) to order in small partitions every 2-3 weeks: You can minimise the risk of loss and the risk of paying to much tax.

Note: The german rules of tax said: No tax for ham-radios and ham-stuff, but 19% VAT.

LESS than 22,00 EUR they don't be interrested on it, if it's more than they could be interrested on it.

I hope (so far god helps) the don't check my ham-license (I'm just in preparation for it), the property of transmitters is not prohibited, onlx the using, but I don't know how far the authority personal knows that...

However, I payed for 4 parcels but I only get one, thats angry.

I think to give a "special" rating for it.

My opinion is:
I ordered "two half chicken in each bag" (as examplke)and not 1/1 in one bag.

But the parcel is now at the tax office near my workplace, I will went there and pick it quick.

God thanks not stolen or victimed by ship accident...

Factoring in the time zone diff, the 8th would be the 9th for HK, and then your into a weekend, and today might be a holiday in HK. So it is possible the seller/shop has not yet shipped the parcel, only generated a shipping label.

In my experiences with USPS, you won't see anything, nor have any warning, before the package arrives in your mailbox. Sometime AFTER the delivery, the tracking status will be updated. USPS tracking helps the shipper, not the receiver, IMHO.

Lynn (D) - KJ4ERJ

>
>Yeah, thanks, Lynn. I did read that when you sent it, and that's my experience as well, but that didn't quite answer my question.

From: Aubrey Turner
Topic: 1830 Message: 1842

Some years ago I looked up the U.S. import tariff for handheld transceivers from China and was surprised to find that most items in that class had no tariff. I tried to find this information again and it appears that everything has been refactored and rewritten so I could not get a straight answer. But, the current harmonized tariff site does not list a tariff for handheld transceivers (the rate is blank).

I've never had an issue with radios and other small electronics.

This is not legal advice and I am not a lawyer though, so if customs seizes your radio don't blame me. ;-)

what kind of tracking number did they give you?

for mine I got one that looks like RC032344037HK

and a link to Hong Kong Post, which tells me that is is being processed for departure.

I can take that number and paste it into www.boxoh.com and it shows as a USPS icon, and tells me it has been accepted in Hong Kong.

The last radio I ordered from China, was shipped on 8-30 and arrived at my house on 9-5, not bad.

From: Bob G1BCZ
Topic: 1830 Message: 1844

Having read many of you talking about Mega409shop, I had a look at it. I can't understand why people buy from them, they are nearly three times as expensive as "409shop" which is, I suppose, why they are called mega409shop. I buy from 409shop free postage and 7 days delivery and stuff sent in multiple parcels to keep unit cost down. Can't fault them.

Yup. My first order of two original UV-3R's left Hong Kong on September 7. My second order, which I placed on September 8, is not list in either the Hong Kong or USPS tracking sites. Not sure what's up with that one.

Have you tried keying the tracking number into the Hong Kong Post website? That will give you an idea if the item has left HK or if it is still going through the HK postal system.

Orders from HK to Vancouver Canada typically take 2, 2.5 weeks, with one of those weeks being the item sitting at Canadian customs.

1846. Clicking Sound on Received Signals

Yahoo group: UV-3R (2011)
Date: 2011-09-14 01:45:24 UTC
From: n6dsp
Topic: 1846 Message: 1846

I'm wondering if anyone seems to be experiencing this during receive:
While monitoring a frequency and hearing somewhat strong signals, I can hear a clicking sound as long as a carrier is present. It stops when a carrier drops, then reappears when another signal is present. I tried the wide/narrow setting and that doesn't seem to change much. This is a random sound and there doesn't appear to be a certain frequency of occurance. It's more noticable on vhf than uhf. I'm wondering if this isolated to my radio, of anyone else has experienced it.

Alarm system at my house causes evenly timed clicking when a carrier is present on a wide range of frequencies @ 2 meters. Disappears when I leave the neighborhood.

3x more expensive ?
Just looked and they are the same as the normal 409shop.
For the record I've been dealing with them for several years now.
Not one problem, and emails get answered within 24 hours.

And if you have problems with big parcels and taxes, there is an
answer to that.

If you can prove that each item was ordered seperatly and is below
the threshold then you don't have to pay the tax !

(It's on the HMRC website)

Just looked at how many orders I've had with 409, exactly 20 of them.

Not one problem.

I think some people on here moan too much.

Besides, these radio's are dirt cheap, so why worry even if you
pay full taxes ? The cost of one beer in most countries ;-)

Q: What are the differences between UV-3R, UV-100 and UV-200?
A: The three models are said to be electrically almost identical, just with a different exterior look and external port, UV-100 and UV-200 compatible with Speaker-mic (409shop item 41-75B), UV-3R is not.

I keep mine in the car door handle. In VHF the received audio gets
disturbed when the electric motor of the side window is actuated.
Nothing heard if receiving UHF.

That's the closest experience to your clicking noise I have heard of.

I have ordered two UV-3R's so far. each from a different HK supplier.

One was marked 'toy $10' and the other 'gift US$15'. Neither attracted UK customs' attention. Both packages neatly gift-wrapped with paper and string.

I think he's proposing it for inclusion in the FAQ? Otherwise why would
he post both the question AND answer?

If the "electronics are exactly the same", why does the Speaker-mic work
on 2 and not the 3rd? Ah, never mind I see the original metion of
"diferent ... external port" in the original post that didn't make it
into your paraphrase of "cosmetic (...buttons...case)".

Topic: 1849 Message: 1856

I add information that Speaker-mic available for UV-100 and UV-200 and not
for UV-3R (regarding 409shop information).

BR,
Yuriy

1862. Re: [UV-3R] FAQ

Yahoo group: UV-3R (2011)
Date: 2011-09-14 14:09:57 UTC
From: Paolo Cravero
Topic: 1819 Message: 1862

Hoping not to upset anyone, I have consolidated a copy of the FAQ as of 2011-09-14 13:30 UTC. I created a PDF document and uploaded it here: http://groups.yahoo.com/group/UV-3R/files/FAQ/ . At least new subscribers will get to see it without reading message archives.

I added a copyright/copyleft Creative Commons license to the document, so that hopefully nobody starts selling it. Editing can continue at the same link and further releases will follow important updates. Contributors with a Google account are welcome to step forward so that I can share with them my "document owner" rights (technically speaking, not content-wise).

A big Thank You to all writers and proof readers that contributed to the FAQ.

73,
Paolo IK1ZYW

PS: Firefox users have to right-click on it and "Save as ..." to their local disk. No idea why it doesn't open in the PDF reader.

PPS: I have already seen a change on the working document (about DTMF). It is not lost, but will be included in the next FAQ PDF. Unfortunately Google Docs does not keep trace of changes so I have to read through to spot any variation!

1864. Re: Angry with mega409shop about shipping...

> China already know to mark $20 or below no matter what the value is and sometimes they'll mark it gift or sample.Â So farÂ I never paid for customs, even on items that were around $200

Of couse they do, but the german customs authorities know this trick and want to see the original auction-printout, the bank-bill or the paypal-bill.

The german customs authorities also know that "sample" is only valid for business customers, civilian user might not ned a "sample", they did not buy 1000 piece of a machine oder a digital-cam later ;-)

Maybee the american officers do other than the germans, but it's good tho know OMHO

1865. Re: UV-3R Mod: Doing the mods with standard equipment

>
> But I can try to explain:
>
> For the audio mod the 33k resistor is directly soldered to the pins on the right hand side of the integrated circuit (looking at the device in front of you where the led and the knop are pointing away from you). I did the soldering like this: I took the resistor and placed it directly on the board. I cut off the conneting wires of the resistor to the right length - After that I put some solder on the resistor's connections and some solder onto the two pins of the integrated circuit (only few solder!). I then placed the resistor directly to the pins of the IC and soldered the resistor's connections to the pins of the IC. This is "relatively" easy, because the pins of the IC are those farest out to the right (pin number 4 and 5).
>
> For the bandpass mod the capacitor is soldered directly to the one end of the inductor. The other connection is soldered to the ground nearby. Be warned, the groundpad is relatively large and needs to be heated up thoroughly - I had to use a temperature of 450 degrees Celsius (the transfer of heat with a small soldering iron is not too good)

> Grant, ZL2BK

Of course, to buy bulk is more cheap.

How much you have payed for one (yours) and how much you should pay for 100?
Don't forget to add shipping, insurance and custom authorities later...

BTW: Bulk-sellers did not give any warranties for theyr goods, but they additional give 2-5% piece for free for defective items.

Hi,
I think you must have 100 of theese items with the same "brand" in the sign, not different like callsigns or name or other.
Therefore you can have it cheaper with a label-printer or give an order to a good engraver ;-)

Topic: 1490 Message: 1874

So, my UV-3R Mark II ordered on September 8 was finally marked as "Accepted" on September 14 on the tracking site. It's still in HK, apparently, and not even prepared for export. You're right, no rhyme or reason--ordering is like playing a slot machine. It's already been a week and it's not even ready to leave HK. Sigh.
At least my two single-line UV-3R's are already on their way.

Been ordering from HK for a couple of years, 7 days to 2 months. No rhyme or reason. Last order I did hours before my buddy from the same place, he got his a week sooner. Don;t order around Chinese New Year, slow boat will get new meanubf.

1875. Programming Question

Yahoo group: UV-3R (2011)
Date: 2011-09-14 17:10:56 UTC
From: mangled99
Topic: 1875 Message: 1875

Hi Guys I'm new to this and not into HAM radio so please go easy on me. My question is, I've just bought one of these to use mainly as a scanner as I am a motor sport marshal. We use 2 frequencys mainly 1 in the UHF and 1 in the VHF range. I bought the usb cable that came with it and it doesn't seem to let me store the 2 frequencys I need in the memory if I store the 455.39 range in memory 1 and then want to store 169.33 in memory 2 I have to switch bands and store it in. This seems fine until I change back to UHF and memory 1 has gone back to the default of 409.75

Is there any way of storing both frequencys or am I doing something wrong.

1876. Re: [UV-3R] Programming Question

Welcome

In the software prgram. On the left you can see Freq-Range.. VHF, UHF or V-UHF1. Make sure its V-UHF1 and it will save in VHF and UHF

Hello, I had that problem as well.
We both did something wrong !

In the programming software, top left corner, field marked:

Frequency Range
Select:
V+UHF1

That will allow you to store both VHF & UHF in the program and then transfer to memory.
However, I could not store FM Broadcast Band.

That's curious. I used the "Save as PDF" on Google Docs platform and uploaded it to Yahoo! Groups. The PDF opened correctly on my machine but not after having been on Yahoo! servers...

Anyway, now I saved in ODT OpenOffice format and then exported into PDF: there should be a valid FAQ PDF in the Files section of the Group. Check it out.

FYI, my order of a red and a blue UV-3R purchased on 8/30 arrived in Utah, USA today, which is 9/14. Nobody was available to sign for them, so I'll have to pick them up at the post office in the morning. This may give an estimate to others who have ordered around the same time.
The two radios were purchased from mega409shop on eBay in separate auctions (because one was red and one was blue) on 8/30 and shipped in separate packages. No accessories were purchased with them.
This afternoon (apparently AFTER they were delivered), USPS has a record of them arriving at my local post office at 6:54am.
Ho Ho Ho, It's Christmastime. :-)

1891. Q&A: Throat Vibration Mic or headset with separate PTT

Yahoo group: UV-3R (2011)
Date: 2011-09-15 09:33:09 UTC
From: vldimitrvov
Topic: 1891 Message: 1891

Hi,
Has anyone used uv-3r with a throat vibration mic with a separate PTT button ? I intend to use it on my motorcycle but cannot find any info about an appropriate headset. Any info about normal headset with separate PTT button would also be highly appreciated
Thanks in advance

1892. Can't figure out how to use that DW (Dual Watch) feature

Yahoo group: UV-3R (2011)
Date: 2011-09-15 09:41:15 UTC
From: cpsorin
Topic: 1892 Message: 1892

Hello.
I've read the FAQ/searched all messages from this group about how to use the Dual-Watch, but nothing...
Could someone tell me how to set those proritary channels ? (I don't have a programming interface)
Only thing I've did with DW is when I set the uv-3r in "FM radio mode" it will pop-up to last VHF/UHF frequency used when there is activity on that frequency.
I hope that Dual-Watch is more than that.

From: szabi_o
Topic: 1892 Message: 1893

Hi,
set both VHF and UHF to the desired frequency, and turn DW on.
After some time (5-10 seconds) the unit will start to switch between the two bands.
(You probably didn't wait long enough)
73, Szabi.

The dual watch feature only works between VHF and UHF VFOs.

What you want is the "Priority Channel" feature... need to set it with the software. You need the cable for this.

1896. Re: UV-3R Mod: Doing the mods with standard equipment

Yahoo group: UV-3R (2011)
Date: 2011-09-15 13:49:34 UTC
From: William Hole AC8FD
Topic: 1714 Message: 1896

Terrific info!

I held my breath and did the volume mod exactly as you suggested, adding insulating sleeving on the lead nearest the circuit board edge. It works very well!!! If doing it again, I might try 22k 1/8 watt instead of 33K 1/8 watt, to lower the minimum volume a little more.

I have not yet found a 33 pf capacitor small enough to fit for the bandpass mod. Does anyone have advice about sources, or specs like voltage rating, to help me find one?

73, Bill AC8FD

Point of reference this ad has the radio dimensions

Also it is Very close in looks to the Yaesu VX3R that has been out for years. Go to Yaesu and compare its overall case. Most sites also call it a minature HT.

It's nice and small that's why I bought two.

For the money it's very impressive

Les

From: wth727
Topic: 1899 Message: 1899

WARNING - 409shop accepted a Paypal payment from me on 9/9/2011, but will not acknowledge or confirm the transaction. There is no record or response in email and no listing of this order at my member login - just the Paypal payment document.

I have sent three separate emails to 409Shop (including transaction documentation) since 9/9. I have had two replies. One reply "we will report your case to the Post Office for investigate" and one saying that the item was shipped three weeks BEFORE the order was placed. My response to THAT was sent 9/11, and there has been NO RESPONSE since

I have previously had good luck with 409Shop. I still do not know what happened to my order. I will explore resolution through Paypal and my credit card company.

I do know that 409Shop Customer Support is the worst I have ever seen, with no apparent attempt to read or understand the question asked.

1904. Colored UV-3R now available from U.S. eBay seller $60 shipped

Yahoo group: UV-3R (2011)
Date: 2011-09-16 00:06:00 UTC
From: Darvell Hunt (N7LN)
Topic: 1902 Message: 1904

Looks like there's an eBay seller in Hawaii, och13, who is now selling colored UV-3R's on eBay. Cost is $60, which includes free shipping, but no accessories (which he also has listed separately).
Might be a reasonable alternative if you don't want to wait for shipment from Hong Kong or deal with international shipping.

I've been purchasing from 409Shop for about 4 years and, while their communication isn't great and I've often found the HK post tracking number wasn't found when I tried to check it, the goods have always arrived quickly. I think my longest wait was for my UV-3R and that was about 10 business days to Australia.

1910. Intermittent signal on receive

Yahoo group: UV-3R (2011)
Date: 2011-09-16 01:56:39 UTC
From: Darvell Hunt (N7LN)
Topic: 1905 Message: 1910

Okay, so tonight I used the new blue UV-3R for the first time, aside from fooling around with it, to check into a local 2m net. While listening to the net, the audio would cut out frequently and the green receive light would go out, BUT at the same time, the signal indicator on the bottom of the display was solid at max level all times, even when the audio was cutting out.
I'm very close to the repeater and it was full quieting, and another small 2m handheld (old Alinco) was sitting right next to it, but only the UV-3R kept cutting out. Has anybody seen this?
The antenna was tight. I checked the battery connection. I checked the the squelch, which was set to 1. Setting the squelch to zero gave static. Everything seemed fine. I hope I don't have a bad solder somewhere inside.
So, I took it to another frequency and played with the other handheld (the Alinco) to see if I could repeat the the problem and I never could. I changed it back to the repeater and the problem was gone. It has been gone for a good 15 or 20 minutes since.
Any thoughts?

Hmm. I wonder. That might be worth looking into. Thanks for the pointer. I was wondering what DSP was.
I also forget to mention that I had the DW, or dual watcher, turned off. I don't quite understand how that works, but made sure it was turned off to be sure.
In any case, the radio isn't doing it now. I hope it doesn't come back. Intermittent problems with unknown causes are the worst.

NKT_3R.exe is the actual name of the program that runs when you
click on the UV-3R icon. Have you rebooted after the install? You may want to
try and re-install over the top and reboot. I have mine running fine on the
same computer setup.

Does it cut out completely then stay out or does it come back after a brief stop? Check to see if the Dual Watch is causing it to cut out. Mine would sometimes do that if it was watching another frequency for activity.
Not sure if this is the same problem you're encountering though.

1918. Re: [UV-3R] Re: Intermittent signal on receive

Yahoo group: UV-3R (2011)
Date: 2011-09-16 03:57:50 UTC
From: Darvell Hunt (N7LN)
Topic: 1905 Message: 1918

I checked the dual watch and it is off.
I've done some further testing and I have more information.
I have two UV-3R's so I put them side-by-side when some guys were talking on the local repeater. I also had a third radio tuned the frequency. The two UV-3R's would momentary go silent and the green receive light would go out, but they were doing it in sync. Most of the time, you would hear the conversation, but every couple of seconds, both radios would cut out at the same time. I thought that was very strange. The third radio, not a UV-3R, would stay solid the whole time.
So, then I took one of UV-3R's and set the squelch to 0 and left the squelch on the other one set at 1. The one with the squelch at 1 kept doing the intermittent receive, but the one with the squelch at 0 stopped doing it entirely and was clear on receive (although, you'd hear static when the repeater stopped transmitting--of course).
So, I'm not sure what that means. People have been complaining that the repeater audio has been steamy lately, so I'm wondering if there's something wrong with the output of the repeater that is causing the UV-3R's to think that the signal has dropped. I don't know if that's the DSP circuit or what.
So, does that help anybody to understand what is going on? I haven't tried it with another repeater, but I'll do that next, if I can find some people talking this late.

Could there be a very strong local signal off channel or even out of band that is causing the 3Rs to block or desense? Can you simulate the effect by transmitting with another radio on a different frequency?

Wow, Julian, I think maybe you've got it!
I setup a test case, as you suggested. I transmitted a carrier wave via simplex from one UV-3R to the other, then with my mobile/base station, I transmitted either 10kHz or 5kHz below that frequency, both with high and low power (maybe 5-10 watts low, 45 watts high). It wouldn't happen every time, but I could often get the receiving UV-3R to drop it's audio signal and shut off the green receive light, just as I'm experiencing from the repeater. The local repeater is about a mile and half from my house, directly up the mountain from me. The local guys have been complaining that the audio from the repeater has sounded steamy lately, instead of full quieting. I'm betting that something is wrong with the repeater, such that it might be sending out a dirty signal, or it may be slightly off frequency.
Whatever it is, it's apparently overloading my UV-3R's and it's shutting off the receiving signal. The radios do not seem to be defective, which was what I thought at first, because both of them are responding in the same way to the signal and shutting off the receiver at the same times.
Would you concur that's likely?
If so, I wonder if there is a solution to my radios cutting out, aside from telling the local club that their repeater needs service. (I'm betting tath I'm the closest HAM to the repeater and others may not be experiencing this problem.)

1921. What RELAYM does

Yahoo group: UV-3R (2011)
Date: 2011-09-16 07:33:12 UTC
From: grantnz2000
Topic: 1921 Message: 1921

I finaly figured out what RELAYM does.
When you transmit into a repeater and release the PTT button with RELAYM off, the UV-3R receiver comes on immediately so you hear the repeater receive squelch etc as well as the repeater tail following the kerchunk.
If you turn RELAYM on, there is a small delay after transmitting before the UV-3R receiver comes on so you don't hear the repeater receiver's squelch closing and if the repeater transmitter has a very short hang time you won't hear that either.
You can try this on your UV-3R quite easily as long as you have another transmitter handy. Set both to the same simplex frequency and with RELAYM off on the UV-3R. Generate a signal with the second radio and then press the PTT on the UV-3R. Keep both transmitters on. Now release the UV-3R PTT and you will hear the receiver come on almost instantly.
Now try the test again with RELAYM on. This time you should be able to detect a short delay before the UV-3R receiver comes on.
Is it useful? You decide. I won't bother using it thougfh.

It's worth checking your FM wide or narrow bandwidth setting.
If you're set to narrow and there is a strong signal local to you the radio will do exactly as you describe: appears to cut out, green light goes out but signal strength bargraph still showing a max signal.
I've had the same problem but only with very strong signals.
Worth a look I'd say.

Slim G4IPZ.

Have you got the radio set to wide or narrow? If set to narrow, then voice peaks could cause the problem of the squelch cutting out. Confirm the radios are set to wide.

I should have added that I meant that the signal you're listening to is strong. I didn't mean one on an adjacent frequency.
This problem has been noted by a few UV-3R owners that I know, especially when working through repeaters still on the older 25KHz spacing in the UK if they are strong, local signals.

I have reinstalled, rebooted, uninstalled, reinstalled and it still crashes!
CHIRP works fine and it looks like it may be easier to use than the UV-3R
software.

From: Remi Bilodeau
Topic: 1905 Message: 1934

Same problem here...

Repeater at 5km, line-of-sight. Squelch and green light drop for 1 seconds and came back for around 150-200ms and pulse again.

I don't see problem on other frequency.

When I monitor the bad signal, if I use my VX-5R on same frequency and transmit at 3 feet of UV-3R the signal is constant.

Where is the problem??? Maybe the repeater modulation is just little over 5khz and UV-3R do not like them. On this repeater we have a have of humming also.

1939. Re: Intermittent signal on receive

Yahoo group: UV-3R (2011)
Date: 2011-09-16 15:07:08 UTC
From: g4ilo
Topic: 1905 Message: 1939

I do think it's likely. I saw a similar comment a while ago from someone over here who took a UV-3R up a mountain put a decent antenna on it and found it was almost unusable due to receiver overload from the various commercial services that were big signals up there.

In fairness to the Boafeng, a lot of the small handies with wide band coverage don't perform all that well in that situation either. The most bomb-proof HT I have is an old Kenwood TH-205 that is over 25 years old and weighs as much as much as a dozen UV-3Rs.

Doing the LPF mod improves immunity to out of band signals, apparently, but it won't help if your local repeater is what's causing the problem.

Julian, G4ILO

--- In UV-3R@yahoogroups.com, "Darvell Hunt \(N7LN\)" <n7ln@...> wrote:
>
> Wow, Julian, I think maybe you've got it!
> I setup a test case, as you suggested. I transmitted a carrier wave via simplex from one UV-3R to the other, then with my mobile/base station, I transmitted either 10kHz or 5kHz below that frequency, both with high and low power (maybe 5-10 watts low, 45 watts high). It wouldn't happen every time, but I could often get the receiving UV-3R to drop it's audio signal and shut off the green receive light, just as I'm experiencing from the repeater.
> The local repeater is about a mile and half from my house, directly up the mountain from me. The local guys have been complaining that the audio from the repeater has sounded steamy lately, instead of full quieting. I'm betting that something is wrong with the repeater, such that it might be sending out a dirty signal, or it may be slightly off frequency.
> Whatever it is, it's apparently overloading my UV-3R's and it's shutting off the receiving signal. The radios do not seem to be defective, which was what I thought at first, because both of them are responding in the same way to the signal and shutting off the receiver at the same times.
> Would you concur that's likely?
> If so, I wonder if there is a solution to my radios cutting out, aside from telling the local club that their repeater needs service. (I'm betting tath I'm the closest HAM to the repeater and others may not be experiencing this problem.)

I had the same problem as well, the audio cutting out on strong signals. The solution was to make sure all the memory channels were set to "wide" and the problem went away.
I believe the default is "narrow" so it's easy to miss.

I don't know if this is the problem you were having, but it fixed it for me.

thanks,
K0DYS

Definitely a good idea--which is why I tried that already when I was having the problem. I set one to narrow and one to wide. It DID change the intermittent problem such that the one with it set to narrow behaved differently from the one set to wide, but both still exhibited the problem.
Good suggestion, though.

It's worth checking your FM wide or narrow bandwidth setting.

If you're set to narrow and there is a strong signal local to you the radio will do exactly as you describe: appears to cut out, green light goes out but signal strength bargraph still showing a max signal.

I've had the same problem but only with very strong signals.

Worth a look I'd say.

Slim G4IPZ.

1962. Re: [UV-3R] Re: Intermittent signal on receive

Yahoo group: UV-3R (2011)
Date: 2011-09-16 21:08:22 UTC
From: The Simpsons
Topic: 1905 Message: 1962

You probably won't notice the difference. The wide setting is for peak deviation of 5KHz and the narrow setting for peak deviation of 2.5KHz. Your modulation will be increased on the transmitter too when switching to wide to match the peak deviation of 5KHz as you would expect.
Why not just experiment and see what you think of the result.

When you switched all the memories to "WIDE" does it still have good sounding audio? No additional hiss or noise ?

So CHIRP and the UV-3R software are not that compatible. Something in the memory is there that will cause this.
Maybe choose 1 program to use.

Perhaps, but it's not due to the cost of the MC13260.

I have seen a Freescale presentation where "high volume pricing" was quoted at $6.

If the presentation is credible, I think the days of $3,000 SDR-powered P25 HTs used by public safety folks are officially numbered...

1970. NAGOYA UT-102 mobile dual band antenna BaoFeng UV-3R

Yahoo group: UV-3R (2011)
Date: 2011-09-17 00:11:49 UTC
From: Darvell Hunt (N7LN)
Topic: 1937 Message: 1970

Anybody have this mobile antenna that on eBay with the following title:

"NAGOYA UT-102 mobile dual band antenna BaoFeng UV-3R"
http://www.ebay.com/itm/250841982968?ssPageName=STRK:MEWAX:IT&_trksid=p3984.m1423.l2649#ht_4297wt_1165
Does it have a mag-mount? Is it decent for the UV-3R? It looks to be. I'm thinking about grabbing one for my tiny convertible, as I don't have space to mount a radio, nor do I really want to modify my car to accept one.

Topic: 1899 Message: 1971

While I appreciate the concern that commenced this thread, and the genuine desire to alert others, I do worry about the damage that hair-trigger reactions can do to reputable vendors.

Like many others here, I have been buying from 409shop for years, probably at least 7 years and have spend many thousands of dollars with them. I have never had a problem with Mr Chan and his staff. All orders have been promptly shipped and the occasional faulty goods happily replaced. I have found this seller entirely reputable and readily recommend them to my friends..

When this problem was reported on the group a couple of days back, I remembered that I had recently ordered a pair of UV-3R Mk2 but had not received a confirmation or tracking number. I went to my account on the site but could not find record of the order, although like the original reporter, my Paypal records contained the invoice and all shipping information. I therefore emailed 401shop yesterday, attaching the Paypal transcation record, to ask whether there had been a problem with the order system. That brought a prompt response giving me my Order number and advising that they would email again once the order had been despatched. Three hours later, I received confirmation of shipping and the tracking number.

The fact that this particular order of mine took 4-5 days to fill and ship was unusual, as they are normally completed within 48 hours, unless a Sunday is involved. They don't work on Sundays. Perhaps this delay was due to being swamped by our orders for the UV-3R?

As with most Chinese sellers, communication can be difficult but the approach I recommend is to keep your English very simple. While their English is less than perfect, I dare say it is infinitely better than our Chinese.

What’s the tiny convertible you have? I have a Kenwood TMV71A in my 2007 NC MX5 (Miata) with APRS as well. I built a dual band antenna which is mounted on the passenger’s side rear deck using the bolt where the removable hard top clips in to. My car is a soft top and I don’t have the removable hard top. The antenna is a 5/8 on 70cm and 1/4 wave on 2 metres. There’s not much room in an MX5 but it can be done with no holes required and still stays neat and tidy.
The only problem is the acoustic noise level at speed!
I have a UT-102 and it works quite well but it’s presently stuck to the inside of the metal garage roof to provide 70cm access for an IRLP node where it’s also working well.

Anybody have this mobile antenna that on eBay with the following title:
"NAGOYA UT-102 mobile dual band antenna BaoFeng UV-3R"

http://www.ebay.com/itm/250841982968?ssPageName=STRK:MEWAX:IT&_trksid=p3984.m1423.l2649#ht_4297wt_1165

Does it have a mag-mount? Is it decent for the UV-3R? It looks to be. I'm thinking about grabbing one for my tiny convertible, as I don't have space to mount a radio, nor do I really want to modify my car to accept one.

Bill Maxwell's excellent letter echos my experiences with 409shop as well. I could not agree more with everything that Bill mentioned with his transactions.
These people have been very helpful in any small issues I may have had in the past and they have addressed all problems quickly and professionally.

As Bill also mentioned, keep the dialog simple in your correspondence with them. Even though their English is better than my Chinese, your concerns will be more easily delt with.

Mr. Chan and his staff have done very well by me in the past and their honesty is not in question with me, but any issues that do arise should be delt with on a professional level on BOTH sides.

These people have nothing to gain by antagonizing PayPal or the credit card companies, and everything to loose by being dishonest.

Regards,
Jake

I drive a Saturn Sky. It might be a tad bit larger than a Miata. I was thinking I could mount the antenna just behind the passenger compartment with the top down. That way I wouldn't have to drill any holes or mount any hardware to my UV-3R.

I heard that the transmit frequencies are just the same as the receive frequencies which is 136-174 MHz and 400-470 MHz. Could someone with this radio confirm if this is true to me? If this is true, then it can transmit outside the amateur radio frequencies. And then is this radio is illegal?

yes, it is true, and it is legal, it is only illegal if you transmit on a frequency that you do not have license or permission to transmit on.

Not quite true. In some countries it is an offence to *own* or *possess*
a radio that can transmit on a frequency you're not licenced for.

1984. RADIO STOP WORKING - strange issue

Yahoo group: UV-3R (2011)
Date: 2011-09-17 08:39:34 UTC
From: hamft2000
Topic: 1984 Message: 1984

Hello!!

after a memory update with the original sw my radio stop working.
When I turn the radio on appears this at the LCD:
DDD.D25

Then the I can move this value until
DDD.D00

and at this moment the radio is freezed.
I can't turn it off, enter the menu, turn the frequency...nothing.
The only things that I can do is to leave the battery.

Additional info:

I can connect the radio to the computer and see it with the original sw an the CHIRP.
When I try to upload memory it seems to work but at the end of the procedure the radio restart and if I read again from the radio nothing is stored.

If I turn on the radio and the first button that I press is the menu I go navigate inside it and change value but if I read again the info from a sw nothing is stored.

I have try to do a reset but without lucky.

Any suggestions?

Thks in advance.
Marco

I use this one:
http://www.ebay.com/itm/250882053382
A little better in the values.
It works well, but don`t expect wonder of
this shortened antennas. :-)

I use the BNC-version with an SMA-adapter.

Try this..

Change the step rate manually on the rig and see what happens.

Yes, I did say that, it seems strange but it works ;-)

I have also discovered that it is more reliable to slow down
the comport used with programming software.

I slow mine down to 1200 baud or less, and it results in less
errors.

1987. Errors after programming with software - some info.

Yahoo group: UV-3R (2011)
Date: 2011-09-17 09:05:20 UTC
From: andyfoad@rocketmail.com
Topic: 1987 Message: 1987

I've mentioned this before, but it might be worth mentioning again.

I have a very early UV3R, no s meter and not 18 menus.
When using the programming software it is very reliable.

I also have a later version, with s-meter, 18 menus etc.

Now I find that when using the memory programming software there
is almost always errors !

Examples are corrupt display (looks like alphanumeric), or
CTCSS not working. Very strange.

I began to notice that if I entered a menu manually, for example
the STEP rate, rotated the dial and then rotated it back to the
desired value the problem was solved.

I suspected that the data rate used for sending programming data
might be too fast and leading to corruption. The poor little
Baofeng can't handle too fast data input.

So I dropped the data rate from the Windows default of 56K or more
all the way down to 1K2 on the comport.

This made the programming much more reliable, and doesn't make
any difference to programming time.

I suspect that going down to an even lower baud rate will make
it even more reliable.

Just thought I'd share my experience.

Hi Andy,
thks for the quick answer.

Unfortunately it doesn't work.
I change the STEP rate at the menu 9 but same problem.
I can turn the vfo but on the lcd appears
06.520
and I can only move up OR down but not up AND down. one way...and the radio stop responding if I touch any button.

From: Paolo Cravero
Topic: 1984 Message: 1990

Marco,

> I have try to do a reset but without lucky.

just to be sure. I did a reset yesterday and did not work the first
time. This is the procedure I used:

- turn UV-3R OFF
- press U/V button (yes, not F-ALERT as stated in the manual), keep it pressed
- press on/off for 2 seconds, long enough to turn on the UV-3R, but
keep U/V pressed
- wait one more second and release U/V too

The radio should beep and show 400.000 MHz.

I initially released U/V too soon and reset did not work.

Hello Paul ... 73.

Trying AO-51, I make several QSO with my FT-60R (with 2 watts - I'm QRPer) using my arrow 2x5 V/U, created by PY4ZBZ - Roland (http://www.qsl.net/py4zbz/antennas/yagips.htm).
Baofeng buy a UV-3R which was sold to a friend. Now I'm waiting for the new UV-3R Baofeng MKII (UV-X4 ??????).
One question. The cross-band has been programmed by the computer using an interface or is there a way to set this function in the rig.
Thanks for any information.
I'm QRV in the same way.

Good weekend and have peace.

I have just got hold of this and managed to kill it by sending saved channel list to it.
I now have 2 rows displaying DDD.D25.
So anybody getting one ..be carefull
I tried factory reset ie u/v and on off but no luck
Menus work ok.
if knob is rotated while DDD.D25 is displayed
it goes to 06.530and will increment if you turn clockwise
turn anti clock and it locks up..
Any ideas apart from return it?
cheers

For what it's worth.

I've made numerous purchases from the 409 Shop and haven't a bad word to say about them. I use PayPal for my transactions with them and never had a glitch. All items have been of excellent quality and well packaged. The shipping times vary, anything from a couple of days to a maximum of 2 weeks but I guess thats more to do with customs than the 409 Shop. They get nothing but the highest praise from me and I always give positive feedback to Mr Chan.

These radios are so cheap and light weight that I've been considering building a wa5vjb cheap yagi and using one on receive and one on transmit and no diplexer. (Well, I already have a Puxing px-2r, so that could be on receive)

Anyone else do something similar?

2002. Re: Q&A: Throat Vibration Mic or headset with separate PTT

Yahoo group: UV-3R (2011)
Date: 2011-09-17 15:23:47 UTC
From: W3FIS
Topic: 1891 Message: 2002

How about something like this:

http://www.ebay.com/itm/Throat-Vibration-Headset-Earpiece-Cobra-2-Way-Radio-/170627552050

or:

http://amocom.en.alibaba.com/product/480612144-210812615/Two_way_radio_heavy_duty_throat_vibration_headset.html

Obviously, you need to re-wire the connector or make an adapter.

The ebay one seems inexpensive enough. Mouser carries the 4 wire plugs.

A friend uses a PAIR of Wouxun HTs for full duplex. I first used a VX-170 and VX-177, simply because I had them. I have used a FT-60R, my Wouxun, and most recently the Baofeng UV-3R, all with equal success.

The stated specs on the Baofeng's receiver are fully as good as the Wouxun or Yaesu HTs.

Since I want to record my QSOs, I have stuck to the Wouxun and Yaesu units, as they have a headphone jack on the speaker microphone. The use of the Baofeng was more or less to see if it would simply work. The earpiece (modified with the ferrite choke) does make operation convenient. I didn't try VOX, however.

If I pick up some 4 wire connectors, then I can easily built an audio pick off to run to my digital voice recorder.

I am using an MFJ diplexer for half duplex operation. The loss in the diplexer is minimal, and other than being able to check if you are hitting the satellite, I don't see a good reason for full duplex operation.

Quick check on e-bay shows Yaesu speaker mics from China for $6.00. Just use the cord and throw away the microphone. Rat Shack for jacks for the adapter, and a small "project" box. That should work. Find a "pickle" switch for the PTT.

Before you uploaded the saved frequency file, did you read the radio and save the resulting file as is? If so, open that file and write it to the radio with the software; this may bring it back to life. If not, see if some kind soul on the list has read and saved a Mk2 radio and can e-mail you a zipped copy.

I program public safety radios for a living (Motorola, mostly), and one of the first things we learn is to read and save the previous codeplug (aka memory file) before making any changes. I have rescued several radios from programming errors that way, and a good thing too, as the typical Motorola radio I deal with retails for over $5000. Talk about a sigh of relief when a radio is saved!!

Many radios will undergo firmware changes between versions, which can make codeplugs unusable for newer version radios. In such a case, the best advice is to read the new radio, save the file as [UV3R yesterdays date], then do a "Save As" and give it a new name such as [UV3R todays date]. Make the necessary changes to the new file, then write to the radio. You should be OK.

Good luck.

Tom

Thanks Tom for the reply..
Like the other versions the radio this one would not read until you sent it a file. So I dont have a working MK2 file..
So if there is someone out there that could zip it up and put it in the files area it would be much appreciated
cheers

This might not be a solution but just an idea. Remove the battery and let the radio sit for awhile.
There could be a master reset someplace or the radio needs reflashing of the micro.
Did you get to play with the radio before the programming failure ? How do you switch from VHF to UHF ? I don't see additional buttons on the radio.

yes, I got to play..there is a little pointer to the very left of display, as you press the u/v button the pointer moves up and down..
also when in the menus pressing the v/u button toggles between menu item and menu state..
cheers

Paul, sorry to hear about your problem. I would guess that since these radios are "software defined" the read/write software you used may not be compatible with the new MKII radios. Was it supplied by the dealer? I would check with them for compatibility. If any other users on the Group have successfully programmed their MKII's they might be willing to pass a copy of their software to the files section or to you.

GOOD LUCK 73 Russ N2RUS

Ok Paul - W3FIs.

Thank you for information.
I read or saw somewhere that it was possible to split the VHF to UHF however, when I decided the problem was building the interface that the UV-3R had already gone. The others will arrive after the holidays and Christmas and New Year return purchases.

The PTT lock up is quickly solved with the large cylindrical ferrite choke from radio shack. Two wraps through the choke, up close to the plug.

440 mono-band performance in the same form factor as the UV-3R. Another of similar size is the PX-2R by Puxing. Both have their proprietary software that makes programing fairly easy...actually fairly simple via keypad. As to going after the NKT-3R...with a price very similar to the Mark I you get dual band for the same money.

I have 7 different Ht's including the Yaesu VX-7R, KG-UVD1p(actually founded and moderate that Yahoo group), Jingtong 2 meter, FD-150 2 meter,NKT-3R (monoband brother of the Baofeng) etc. All of these radios (some even less expensive than the UV-3R) have their pros and cons. None of them, however, lock into transmit regularly when used with the earpiece/mic. Pointing this out and seeking group input/solution enabling one to "stick in your pocket as a ......" is one of the purposes of groups such as this.

Well done! I have downloaded it and tried it with my Mk1 and it works with that as well. This program is actually for the UV-3R. I did take care to read from the radio before changing anything, just in case.

But I have discovered a bug with setting the priority channel. You choose the priority channel from a drop-down list of channels that have been used. If you don't have all channels filled from 1 to the one you select then the priority channel is not the one you selected but the channel corresponding to taht one's position in the list. E.g. I wanted to make channel 20 the priority channel but the radio started checking channel 14 because 20 was the 14th filled clannel in the list!

Interesting, this program has two frequency range options, one to limit the range 144-146 and 430-440. There is also a column called Name where you can put a name for each channel, but it is disabled. Perhaps with a later model you will be able to put channel names.

From: gm4cid
Topic: 2028 Message: 2028

While I am impressed with the UV-R3 being incredible value for money I am puzzled as to why Vero do not correct the simple but very annoying issues with their otherwise well thought out and engineered product.

Question - is the unit as currently shipped really fit for purpose or should these problems be resolved?

I doubt that a fix would increase manufacturing costs by by more than a penny or two in anybody's money.

Come on Vero, listen, implement these simple fixes, and be proud of your product rather than continue to manufacture one with known issues believed to be 'good enough' for your amateur radio customers.

I do enjoy the standard and content of discussions on this group however can we (should we) persuade Vero to take action and produce an even better product?

The files saved by the new software have the extension .3R instead of .dat. They appear to be the same format, but if you rename a .dat file to .3R and try to load it the software reports "Mistake Model!" and everything is blank. So all the .dat files in the Files section will be obsolete.

Mine is different, you will see from photos i posted, buttons are round
Aerial is slightly longer (only one supplied) I have not checked it for swr yet to see if it is dual band and the icons in the display are in different places..ie battery level etc is at bottom of display.
So might be a few variations like the uv-200 etc in the pipeline
to keep us all guessing.
So far I dont think any of the issues discussed here have been addressed.
i still get lockup with ext microphone..fixed by a small cap across socket ..perhaps volume is slightly quieter.
cheers

The answer is no -- pinouts different. However, since the plug for Yaesus (FT-60R) is the same plug, I can't see why you couldn't re-wire a Yaesu speaker mic. I note that CHEAP ones are on E-Bay for around $7.

The pinout is posted on this web site, I believe.

Fiat owns Ferrari too but I don't think they're about to change the name from Fiat to Ferrari.
BTW Fiat in the US stands for "Fix it again Tony"

Since Fiat of Italy owns more than 50% of Chrysler I suppose they can use the Chrysler name in their German advertising. Does 409shop own more than 50% of Yaesu?

Of course,
they 're wholeseller and use that good name for adverts.

Expl: http://chrysler.de/ ist owned by FIAT Germany ;-)

In other words, you are mad at someone who sold you a knockoff of a Japanese radio at 1/4 of the price you would have paid because they saved money on postage and in doing so prevented you from saving money by avoiding paying taxes due.

2059. UV-X4/UV-3R MK2

Yahoo group: UV-3R (2011)
Date: 2011-09-19 01:31:02 UTC
From: dd1wks@ymail.com
Topic: 2059 Message: 2059

Just uploaded some findings on the UV-X4/UV-3R MK2.
Not verified because I do not possess a MK2 version yet.
So use with caution!
Feedback appreciated.

2064. Receive LED blinks

Yahoo group: UV-3R (2011)
Date: 2011-09-19 03:32:22 UTC
From: Lee - N9LO
Topic: 2064 Message: 2064

While receiving a local repeater the audio would cut out for about 1/2 of a second and the green receive LED would go out while the audio is out. I think I saw something like this recently but with the huge amount of messages I cannot find it. Any ideas? Thanks.

Lee - N9LO

2065. Re: [UV-3R] Receive LED blinks

From: Darvell Hunt (N7LN)
Topic: 2064 Message: 2065

Yes, my two UV-3R's are doing exactly the same thing. It appears that somehow the repeater is overloading the receiver and it's shutting down temporarily. It seems to be built into the software/hardware, because I had TWO units monitoring the same repeater and they audio would cut out and the green receive button would go off at exactly the same times on both radios.

I did a test and was able to repeat this behavior on the UV-3$'s by transmitting a strong signal 5kHz off frequency from the one I was listening to. Either the repeater signal is just too strong or it's over-modulating or it's slightly off frequency, or something, I'm not sure. I've only observed this from ONE local repeater, though--but, I haven't had the radios long so maybe I just haven't seen it elsewhere yet.

I was driving around town yesterday chatting with a guy on the UV-3R and my signal was blocked by trees and houses and it was fine, although not as strong into my receiver. Once I broke out into the open with a clear shot to the repeater, the signal got very strong and then the receiver started cutting out.

So, I'm very disappointed in this behavior, because this is my favorite local repeater. If I can't figure out how to "fix" my radio, or tell the owners of the repeater that there's something wrong with their transmitter, I'm not going to be able to use these radios very much. I'm hoping there's some sort of resolution, because I really like them.

So do you mean the squelch is cutting in and out with a strong signal?

If so, the way the squelch works is it looks for noise either side of the signal. If there is a lot of noise there the squelch closes the audio path. If there's some or little or no noise there it lets the audio through.

So.... if a signal is overdeviating and producing noise sidebands the squelch will think this to be no signal and close the squelch, only to open again when the person reduces the level of their voice or stops speaking. As Grant mentions, if you're using Narrow setting with a wide transmission it can have the same effect....

Well the squelch is strange anyway.... settings 1,2,6,7,8 and 9 are all the same.... it lets weak signals through. Settings 3,4 and 5 are all the same and don't let weak signals through.

It may be that the only answer is for the repeater keeper to turn the tx deviation down slightly. It could be that a lot of rigs are having the same problem with that repeater.....

2074. UV-3R programming

Yahoo group: UV-3R (2011)
Date: 2011-09-19 13:36:45 UTC
From: rhughes36067
Topic: 2074 Message: 2074

Just got my UV-3R last Thursday. The radio seems to work great but I'm having a heck of a time getting any of the programming tools to work. Using the Baofeng cable I can't get any computer in the house to recognize it. I think the drivers are loaded because I've used those same systems to program my FT60R and my scanner.
My first thought is that it's just a bad cable. Does anyone know an easy way to check that out? Will a Yaesu cable work??

Thanks!

When *I* noticed the problem, it was set to wide, but I've played with just about every setting to see how it affects the problem, including setting it to narrow.

Nothing has worked, except setting the squelch to ZERO. Of course, you get the static when no signal is present, but then the audio doesn't cut out and the green LED stays lit.

Do
you have the radio set to WIDE or NAROW? You can have this problem if set to NARROW.

Subject:Re:
[UV-3R] Receive LED blinks

Yes, my
two UV-3R's are doing exactly the same thing. It appears that somehow the repeater is overloading the receiver and it's shutting down temporarily. It seems to be built into the software/hardware, because I had TWO units monitoring the same repeater and they audio would cut out and the green receive button would go off at exactly the same times on both radios.

I did a
test and was able to repeat this behavior on the UV-3$'s by transmitting a strong signal 5kHz off frequency from the one I was listening to. Either the repeater signal is just too strong or it's over-modulating or it's slightly off frequency, or something, I'm not sure. I've only observed this from ONE local

repeater, though--but, I haven't had the radios long so maybe I just haven't seen it elsewhere yet.

I was
driving around town yesterday chatting with a guy on the UV-3R and my signal was blocked by trees and houses and it was fine, although not as strong into my receiver. Once I broke out into the open with a clear shot to the repeater, the signal got very strong and then the receiver started cutting out.

So, I'm
very disappointed in this behavior, because this is my favorite local repeater. If I can't figure out how to "fix" my radio, or tell the owners of
the repeater that there's something wrong with their transmitter, I'm not going to be able to use these radios very much. I'm hoping there's some sort of resolution, because I really like them.

While receiving a local repeater the audio would cut out
for about 1/2 of a second and the green receive LED would go out while the audio is out. I think I saw something like this recently but with the huge amount of messages I cannot find it. Any ideas? Thanks.

The deviation could still be too wide for WIDE though. Being DSP based the UV-3R filters probably have steeper skirts than analog radios.

From: W8AQ
Topic: 2079 Message: 2079

Way too many HT's in the shack for a ham with only one repeater close enough to hit! So I'm selling a bunch of them, including a Baofeng UV-3R. Less than a month old and hasn't been used 10 minutes. $40 plus actual shipping (your choice...USPS Priority, Parcel or UPS). Also selling my Yaesu VX-3R, FT-60R, Icom IC-W32A and Wouxun UVD-2, as well. Yeah...too many HT's for a guy with one repeater handy!

2081. "Sticky" receiver ? (Might be something for the FAQ ?)

Yahoo group: UV-3R (2011)
Date: 2011-09-19 18:29:21 UTC
From: andyfoad@rocketmail.com
Topic: 2081 Message: 2081

Has anyone discovered the following...

The Baofeng receiver sometimes "sticks", by that I mean I can have my Wouxun and Baofeng monitoring the local repeater at the same time.

However sometime the Baofeng receiver fails to go into action and needs a "push", like pressing the PTT or a button push to "wake" it up.

Doesn't happen all the time, but I have noticed it occasionally.

Paul ... Just curious, not trying to be critical or confrontational, but what factor(s) went in your decision to go with the UV-200 rather than the UV-3R Mark I or II ??? I was also considering the UV-200 but have decided to go with the newely released UV-3R Mark II .... dual display was the kicker for me. The only advantage I see with the UV-200 is that it will accept a speaker/mic.

Not sure on that one
Seems like the NKT-R3 would also work on UHF only but with a slightly different amount of buttons and functions.
I guess you could use it for patrols or in a UHF intensive area.
Where I am there are both UHF and VHF repeaters.
Some towns have a UHF repeater and then a state wide VHF system too

Hi,

Recently joined the group and have been reading up on the UV-3R while waiting for it to arrive.

Ordered mine from The 409 shop HongKong, it was posted on the 16th and to my suprise arrived here at my door in Liverpool this morning.

Had a quick play with it and all seems ok, reading other peoples experiences with the radio helps a lot.

Jules.

Almost all of the USB programming cables you get from the Chinese radio shops use the Prolific PL-2303 chipset. I have a variety of radios and have several USB cables I've acquired from 409Shop. They all use the same driver. However, I've found that if you download the most up-to-date version from the Prolific website none of these cables will work. The symptom that I would see is that the cable would not be recognized (i.e. the same symptoms you are seeing).

I had these problems both on Windows XP (SP3) and on Windows 7 64-bit. Using an older version of the driver fixed the problem.

In particular, I found the version from the G4HFQ site to work (I use his FTB7800 software):
- http://www.g4hfq.co.uk/faq.html

To be safe, though, uninstall the newer PL2303 driver, then reboot before attempting to install the older version.

Others on this forum seem to have found success using the PL2303 driver from the Woxun.us site:
- http://www.wouxun.us/item.php?item_id=222&category_id=50 <http://www.wouxun.us/item.php?item_id=222&category_id=50>

$46 price and Curiosity were my motivation. It appears to be a UV3R. Maybe the buttons are a different shape. It shipped with a UV3R and the following accy's;
Charger/Stand
Two ants
Plastic Case
Belt Clip
Earbud/Mic
Pen
UV3R Manual
Neck Lanyard

One repeater contact and it seems to work fine so far.

2095. UV3R MARK 2 arrives - quick report.

Yahoo group: UV-3R (2011)
Date: 2011-09-20 17:33:22 UTC
From: andyfoad@rocketmail.com
Topic: 2095 Message: 2095

Postman left me a present, a new MK2 version.

The Mk2 comes in a slimmer, and more sombre styling of cardboard box thant the red/pink box of the MK1. Looks quite professional.

A new dual band antenna is provided. It's quite small but it does work much better than anything I've seen *in the same size range*.

Well done Baofeng.

There's not much else that's different.

The volume level seems to have been fixed to something more sensible when used at it's lowest setting.

The earphone jack now works properly, giving plenty of receiver audio out to any speaker mics.

However I'm a bit dissapointed at the at the way the dual receiver works.

It seems you can select the top line of the display to any frequency in VFO or memory mode ok.

But the second line is stuck on VHF and VFO mode !!!

This sucks !

It means you only get at best VV/UV active bands, but cannot do UU.

Am I missing a trick here or what ?

The 2m harmonic problem still seems to be there. (I did a quick test using a second receiver with my modified Mk1 and the unmodified Mk2.

The S-METER on the MK2 is much smaller and a bit more difficult to read.

In fact I think I prefer the Mk1 display, it just seems a but nicer to me.

So overall, what do I think ?

It's only a tiny bit better than the Mk1 and hardly worth bothering with an upgrade if you already own a Mk1.

Personal score: (Max 5 points)

Mk1 gets 4/5
Mk2 gets 4.2/5

Cool, thanks for the quick review. I'm hoping to get mine in the next few days, too--at least by Friday, anyway.

I'm also hoping that the receiver overload problem has been fixed, such that my audio will not cut out from my favorite repeater when I have a strong signal. Somehow, I'm thinking that's not going to happen, though.

I've been wondering about the display as well. I think I may find the same thing as you--that I'll like the original display better. I'm hoping not, but maybe I'm hoping in vain.

Even so, I'm excited to get all of the accessories that I ordered with the Mark II, including stuff for my red and blue UV-3R. (My son now owns the blue one, having passed his first HAM text on Saturday. Waiting on the FCC for his call sign.)

Wish the USPS tracking site would tell me where mine is right now, but I'll keep playing the guessing game until it arrives.

I also recieved one yesterday.

The dual band antenna works very well allowing me to hit a mountain top repeater (3500 feet) thats about 60+K from my QTH on both 2M and 70CM (VHF&UHF)

Thanks for the report regarding the speaker mic, thats very good to know.

The best way to describe the screen is to think of a larger display, but same resolution. Not as nice, but 2 frequency displays and the price can't be beat.

I do agree that for an owner of a MK1 this is not a big upgrade, however for someone waiting to get one, grab the MK2 over the MK1.

Yep, they have done a good job with the antenna. Far better than
any Icom or Yaesu I've seen supplied as standard.

> I do agree that for an owner of a MK1 this is not a big upgrade, however for someone waiting to get one, grab the MK2 over the MK1.

Yeah I agree too.

If you already on a Mk1 it's probably not worth upgrading.
But it *just* has the edge if you are looking for a new rig.

But my real disappointment if the lack of ability doing UU operation,
and being able to select the memories on BOTH parts for the display.

It's a big disappointment,

regards,

Andy

Well it seems there is a trick, not perfect but..

Firstly, if you want the rig in VV or UV mode (VHV/VHF or UHF/VHF)
you can do it. But the VHF side is in the VFO mode only, but on
UHF you can select from memory. This requires the DW dual watch
function to be switched on. You will see the indicator jump between
each frequency when it changes.

But what happens if you want to monitor two UHF frequencies ?

Well it's a bit more complicated. You have to use the Priority
Watch function instead ! Then use the PC software to hard set a
priority channel. (This can be ANY freq, UHF or VHF).

You can't select what priority channel to use unless you do it via
the PC, arrrghhh !

So yes, you can monitor two UHF channels, but you have to go about
it an odd way ;-)

Hope this helps some of you.

I'm so glad to hear about the antenna on the MARK II performing so well. The UHF antenna (of the Mark I) does a better job on VHF than the Yaesu that comes with the VX-3R.

From: "andyfoad@..." <andyfoad@...>

Subject: [UV-3R] UV3R MARK 2 arrives - quick report.

Postman left me a present, a new MK2 version.

The Mk2 comes in a slimmer, and more sombre styling of cardboard box thant the red/pink box of the MK1. Looks quite professional.

A new dual band antenna is provided. It's quite small but it does work much better than anything I've seen *in the same size range*.

Well done Baofeng.

There's not much else that's different.

The volume level seems to have been fixed to something more sensible when used at it's lowest setting.

The earphone jack now works properly, giving plenty of receiver audio out to any speaker mics.

However I'm a bit dissapointed at the at the way the dual receiver works.

It seems you can select the top line of the display to any frequency in VFO or memory mode ok.

But the second line is stuck on VHF and VFO mode !!!

This sucks !

It means you only get at best VV/UV active bands, but cannot do UU.

Am I missing a trick here or what ?

The 2m harmonic problem still seems to be there. (I did a quick test using a second receiver with my modified Mk1 and the unmodified Mk2.

The S-METER on the MK2 is much smaller and a bit more difficult to read.

In fact I think I prefer the Mk1 display, it just seems a but
nicer to me.

So overall, what do I think ?

It's only a tiny bit better than the Mk1 and hardly worth bothering
with an upgrade if you already own a Mk1.

Personal score: (Max 5 points)

Mk1 gets 4/5
Mk2 gets 4.2/5

hey all, I just joined.
So, does the new dual band antenna still take care of the second harmonic issues on VHF? Or has the radio been redesigned to eliminate that issue?
I have, what I'm guessing is the mk I since it came with two separate V/U antennas...and the VHF antenna acts as a filter because without it, the radio produces too much signal on the second harmonic on VHF.

Beyond that, I love the UV3R. It works exactly how I expected, and a little better.
I'm getting allot of TX time out of the battery as well...though I'm using mostly low power into a very local V/U repeater.
The intermod rejection is quite limited, but with rx tones, it is tolerable.
Definitely more than worth the money I spent :)

Regards
Colin

Almost all of the USB programming cables you get from the Chinese radio shops use the Prolific PL-2303 chipset. I have a variety of radios and have several USB cables I've acquired from 409Shop. They all use the same driver. However, I've found that if you download the most up-to-date version from the Prolific website none of these cables will work. The symptom that I would see is that the cable would not be recognized (i.e. the same symptoms you are seeing).

I had these problems both on Windows XP (SP3) and on Windows 7 64-bit. Using an older version of the driver fixed the problem.

In particular, I found the version from the G4HFQ site to work (I use his FTB7800 software):
- http://www.g4hfq.co.uk/faq.html

To be safe, though, uninstall the newer PL2303 driver, then reboot before attempting to install the older version.

Others on this forum seem to have found success using the PL2303 driver from the Woxun.us site:
- http://www.wouxun.us/item.php?item_id=222&category_id=50

I hope you get it soon!
Actually if you get them on ebay it shows the delivery estimate in the actual posting but that doesn't always mean it comes within that time frame I guess.
I'm still waiting for the red UV-3R ordered couple saturdays ago.
Sounds like you'll have a nice radio when you get it though.

2107. Wide/Narrow settings.

Yahoo group: UV-3R (2011)
Date: 2011-09-21 11:40:37 UTC
From: Naqoyqatsi (aka the ICM)
Topic: 2107 Message: 2107

Has anybody got the facilities to check the difference between the wide and narrow settings on the UV-3R?
I'd be interested to know what the difference in transmitted deviation is between the two modes and also what difference there is between the receive bandwidths.
The reason I'm interested is that I have been doing comparisons between the UV-3R and an Alinco DJ596 changing the wide/narrow settings on each rig and transmitting back and forth.

The receive side uses 2 different filters depending on the bandwidth setting.
On transmit the Alinco claims a MAXIMUM deviation of +/- 5KHz with the settings being 4.5KHz (wide) and 2.2KHz (narrow).

To my mind that makes the narrow setting probably too narrow for most amateur repeater use and I suspect that the settings are similar on the UV-3R which may account for the low level audio reports some people are mentioning and also for the cutting out similarly experienced on receive.

When I first got mine, I checked TX deviation and RX bandwidth, wide and narrow.

They were pretty much correct

Max deviation wide, +/- 4.8kHz
Max deviation narrow, +/- 2.4kHz

Apparent RX -6dB bandwidth wide +/- 8kHz
Apparent RX -6dB bandwidth narrow +/- 4kHz

Adjacent channel selectivity measured as ETS300-086 was 70dB wide and 58dB narrow.

All in all, pretty good figures.

The only really bad part was the 2nd harmonic of 145 MHz which was only -27dB on carrier when on low power.

It should be 30+dB lower, but there are plenty of descriptions on here about how to modify the LPF.

Hi Darvell. I wonder if you missed my explanation about this problem you're having and that the problem could well be that the repeater itself is overdeviating (and the technical reason)?

Have you tried your UV3R with another repeater of similar signal strength and was the UV3R responding in the same way or not? Have you tried a different HT with the repeater with which the UV3R 'cuts out'? Have you listened to normal non-repeater QSOs and has the UV3R still cut out with their transmissions? Also, what is the callsign of this repeater so we can do a search to see if others have commented on it elsewhere?

I'm sure you would agree that we wouldn't want the UV3R to get a bad name of 'cutting out' when actually the problem lies elsewhere?

Origin Post is Preparing Shipment

Processed Through Sort Facility, September 15, 2011, 1:26 pm HONG KONG

My purchase date was 9/08, but it didn't get into the system as accepted until 9/14. Interesting that the acceptance time is identical as yours, but then mine was processed before yours. But, gauging by the time between "Processed Through Sort Facility" and when they arrived for my previous two UV-3R's (a bad thing to do, I know), I'm expecting the Mark II by Friday.

It would be nice if it came by tomorrow, because tomorrow night I'm doing a demonstration at my local Church of my emergency "grab it and go" HAM communication kit and I'd like to throw the Mark II in the case with my other gear. We'll see.

Subject: [UV-3R] Wide/Narrow settings.

Has anybody got the facilities to check the difference between the wide and narrow settings on the UV-3R?
I'd be interested to know what the difference in transmitted deviation is between the two modes and also what difference there is between the receive bandwidths.
The reason I'm interested is that I have been doing comparisons between the UV-3R and an Alinco DJ596 changing the wide/narrow settings on each rig and transmitting back and forth.

The receive side uses 2 different filters depending on the bandwidth setting.
On transmit the Alinco claims a MAXIMUM deviation of +/- 5KHz with the settings being 4.5KHz (wide) and 2.2KHz (narrow).

To my mind that makes the narrow setting probably too narrow for most amateur repeater use and I suspect that the settings are similar on the UV-3R which may account for the low level audio reports some people are mentioning and also for the cutting out similarly experienced on
receive.

No, I didn't miss it. That's what I believe the problem is. I have not observed this problem using another repeater, but to be fair, it doesn't happen all of the time on this repeater, and I haven't listened to other repeaters very much since I got the two radios last week.

I thought the problem might be that my house is about a mile from the repeater, but I observed the problem on Saturday about 10 miles from the repeater while announcing that my son passed his first HAM test. So it's not just proximity.

And, yes, I tried an older Alinco DJ-S11 2m handheld, while my two UV-3R's were also on. All three heard the same signal, but only the two UV-3R's cut out on receive--and EXACTLY at the same time. The green receive lights were synced perfectly when cutting out. I changed one to NARROW and it still cut out, but was no longer synced with the other one.

Hi Darvell. I wonder if you missed my explanation about this problem you're having and that the problem could well be that the repeater itself is overdeviating (and the technical reason)?

Have you tried your UV3R with another repeater of similar signal strength and was the UV3R responding in the same way or not? Have you tried a different HT with the repeater with which the UV3R 'cuts out'? Have you listened to normal non-repeater QSOs and has the UV3R still cut out with their transmissions? Also, what is the callsign of this repeater so we can do a search to see if others have commented on it elsewhere?

I'm sure you would agree that we wouldn't want the UV3R to get a bad name of 'cutting out' when actually the problem lies elsewhere?

So, to be clear, the second line of display will NOT operate in memory mode but only in VFO? In other words, you cannot display a memory channel on the top line and a memory channel on the second line? If this is the case it is worthless in my opinion. I'll stick with the Mark I.

I'm going to guess that it is likely intermod.
The UV3R's are not great at intermod rejection.
So, it would stand to reason, that both radios would cut out at the same time, in the same location, if they were receiving strong intermod signals.
Even if you have an RX tone programmed in, as soon as you are receiving the repeater output signal, the receiver of the UV3r is open, and will receive the intermod just like if you had no tone programmed for rx.
Putting the UV3R beside my Icom IC T90A, using similar antennas, and listening to the same repeater output, I often hear the intermod coming in underneath the repeater's strong signal on the UV3R, and not on the Icom.
So, again, I suspect it's merely an intermod rejection issue and nothing more.

Your understanding is correct.

Top line can select VHF or UHF, in VFO or memory mode.
Bottom line is VFO only on VHF.

Nothing amazing, just a slight improvement.

I agree with all your comments..not a big improvement..maybe a bit easier to handle the menu items..
Anyhow enjoy and don't brick it with the mark 1 software as i did,
although the proper markII software sorted it out..
i still think there might be issues with the prolific driver in 64bit win7 ..it works fine every time in 32bit win7.
Once again it is what it is "cheap as chips"
cheers
paul

mine was ordered on 9/9 and I think from the same seller you did - I ordered a second one from another seller (he's new a ebay but ppl are claiming fast ship) we'll see. His tracking shows AIRMAIL so it might be faster than the other one. Let me know as soon as you get yours and I'll do the same.

on the "grab it and go" is that during the rapture ? (hahahahaha)

Here's mine:

Acceptance, September 14, 2011, 12:44 pm HONG KONG
Origin Post is Preparing Shipment

Processed Through Sort Facility, September 15, 2011, 1:26 pm HONG KONG

My purchase date was 9/08, but it didn't get into the system as accepted until 9/14. Interesting that the acceptance time is identical as yours, but then mine was processed before yours. But, gauging by the time between "Processed Through Sort Facility" and when they arrived for my previous two UV-3R's (a bad thing to do, I know), I'm expecting the Mark II by Friday.

It would be nice if it came by tomorrow, because tomorrow night I'm doing a demonstration at my local Church of my emergency "grab it and go" HAM communication kit and I'd like to throw the Mark II in the case with my other gear. We'll see.
